Last time: Tangent Bug

What does BugX assume that Random Walk does not?

What does BugX assume that Random Walk does not?

Localization: knowing the robot's location, at least wrt. distance to goal

What do search algorithms assume that BugX does not?

What does BugX assume that Random Walk does not?

Localization: knowing the robot's location, at least wrt. distance to goal

What do search algorithms assume that BugX does not?

A graph of valid locations that can be traversed

Suppose we have or can build such a graph...

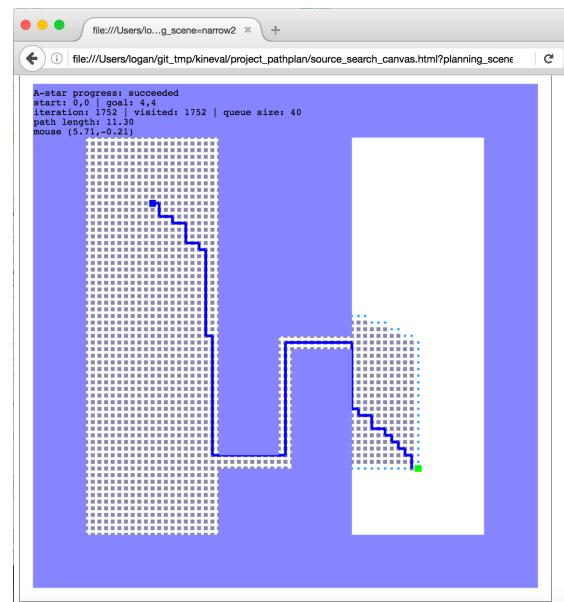

Approaches to motion planning

- Bug algorithms: Bug[0-2], Tangent Bug
- Graph Search (fixed graph)
 - Depth-first, Breadth-first, Dijkstra, A-star, Greedy best-first
- **Roadmap Search (build graph):**
 - **Probabilistic Road Maps, Rapidly-exploring Random Trees**
- Optimization (local search):
 - Gradient descent, potential fields, Wavefront

Will our current search methods apply to this robot?

Project 1:
2D Path Planning

Project 6:
N-D Motion Planning

Will our current search methods apply to this robot?

Assumptions:

- Known graph of traversability
 - How big is this graph? How was this graph built?
- Known localization and map/obstacles
 - How do we detect collisions?
 - Is our robot just a point in workspace?
- Known link geometry
 - Does robot geometry change wrt. configuration?

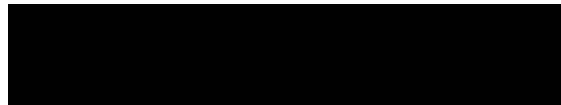

Configuration Space (or C-space)

- C-space (Q) is the space of all possible configurations (q) of a system
 - kinematics: geometry of possible configurations, without respect to physics
 - dynamics: evolution of configurations over time wrt. physics
- Each degree of freedom is a dimension of C-space
- The span of C-space is constrained by obstacles (QO_i), joint limits, etc.

Let's consider some examples
of configuration spaces

Configuration Space

- Consider a robot $d=21$ DOFs, where each DOF can take 1 of $n=10$ angular values
- How many configurations?

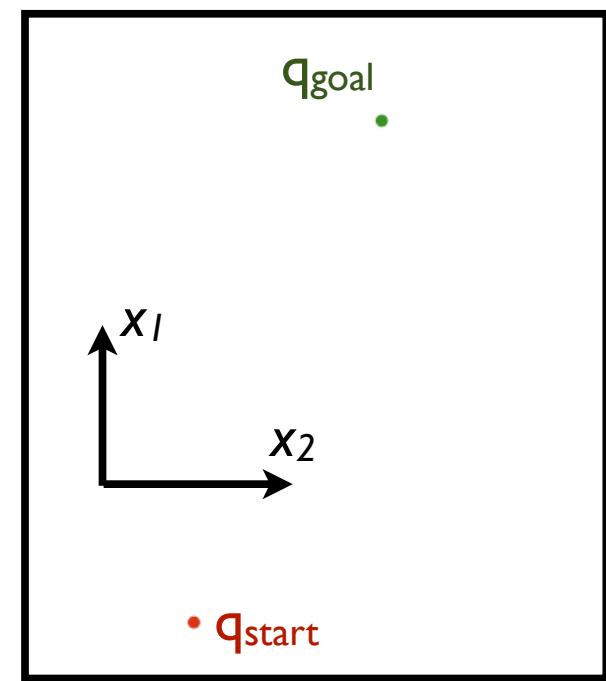

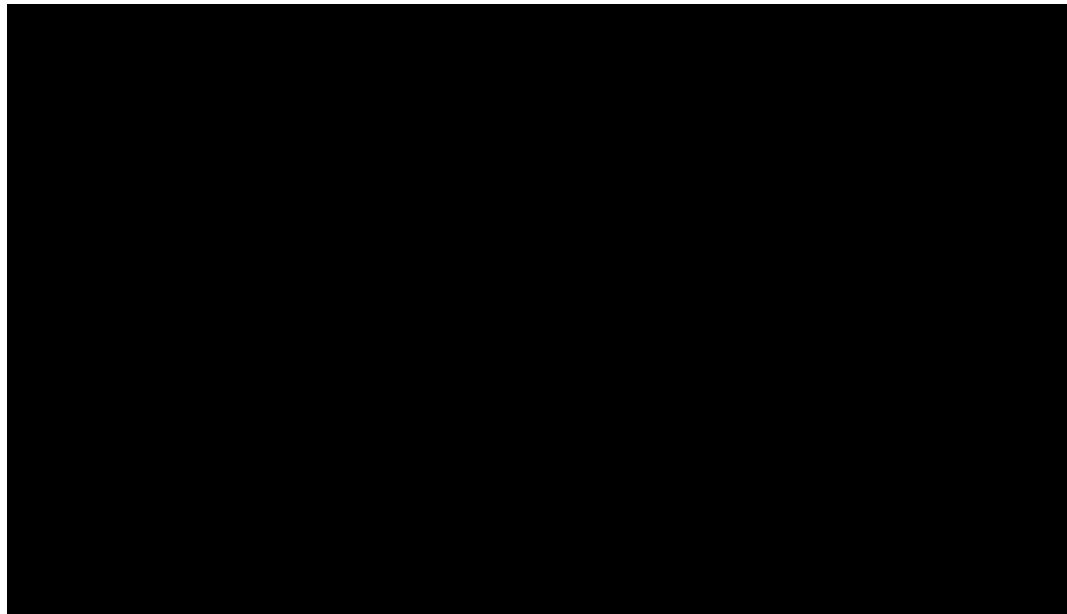

Configuration Space

- Consider a robot $d=21$ DOFs, where each DOF can take 1 of $n=10$ angular values
- How many configurations?
 - $10^{21}, n^d$ in general
- “**Curse of dimensionality**”
 - exponential growth of C-space wrt. number of DOFs
- Obstacles also create discontinuities and nonlinearities in C-space

C-space examples

- How many configurations are in the C-space of a planar point robot in a bounded rectangular world?

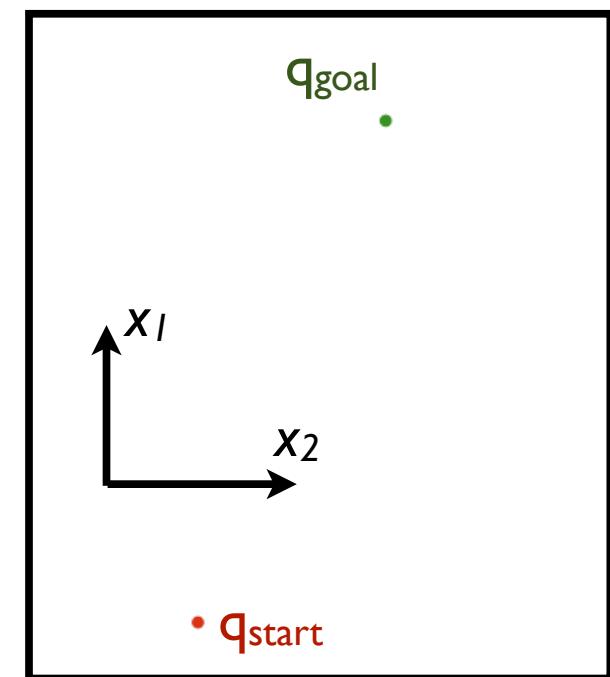

C-space examples

- How many configurations are in the C-space of a planar point robot in a bounded rectangular world?

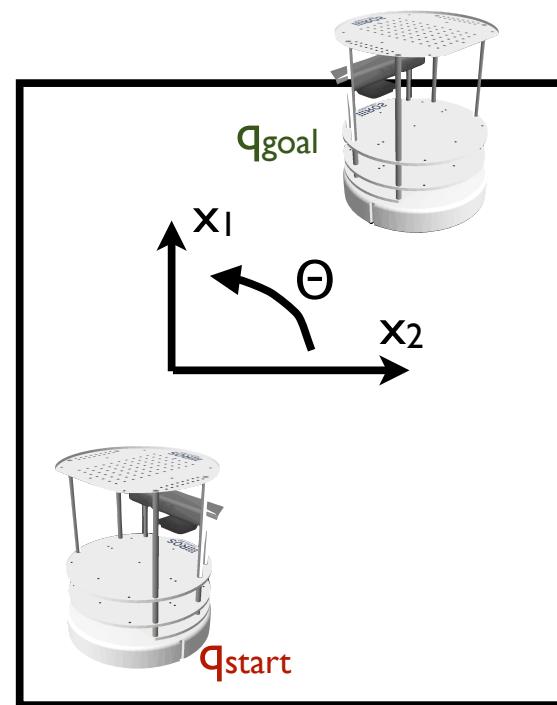

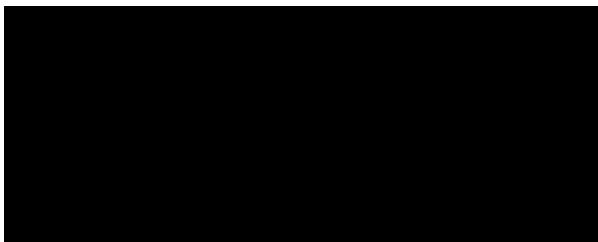

- DOFs: 2, $\{x_1, x_2\}$
- Number of poses is infinite
- C-space: \mathbb{R}^2

Topologically, this C-space is a homeomorphism of \mathbb{R}^2

C-space examples

- What is the C-space of a Turtlebot?

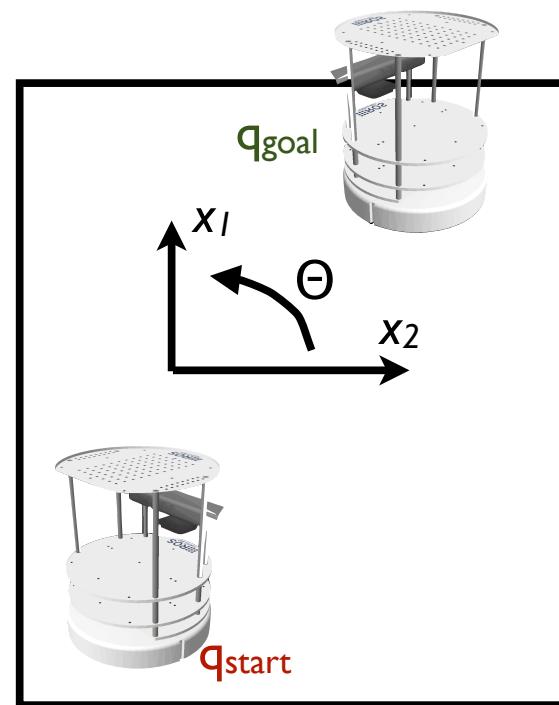

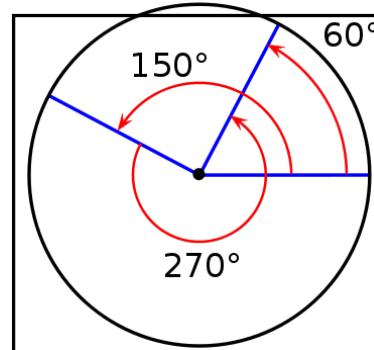

C-space examples

- What is the C-space of a Turtlebot?
 - DOFs: 3, $\{x_1, x_2, \Theta\}$
 - C-space: $\mathbb{R}^2 \times S^1$

S^1 is the 1-sphere
group of 1D rotations

S^n is the n-sphere

$S^1 \times S^1 \neq S^n$

C-space examples

- What is the C-space of a Turtlebot?

- DOFs: 3, $\{x_1, x_2, \Theta\}$

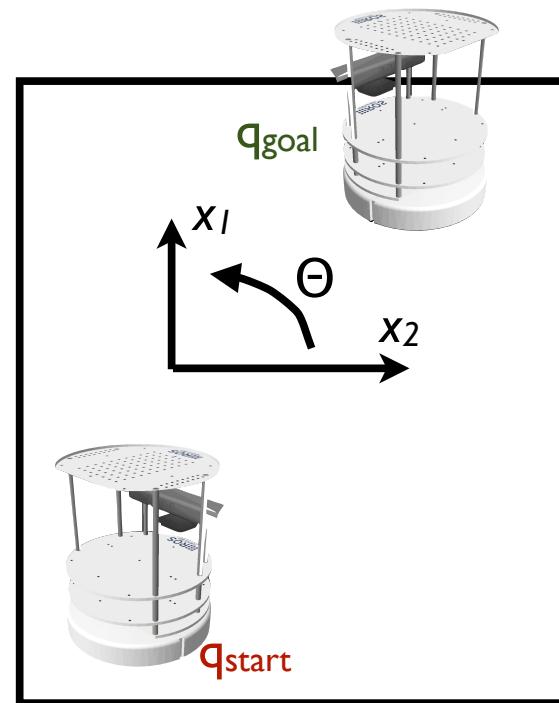

- C-space: $\mathbb{R}^2 \times S^1$

2D translation

rotation in 2D

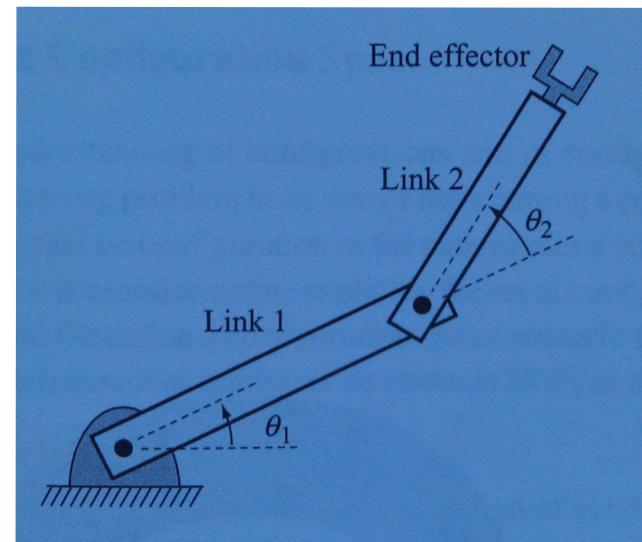

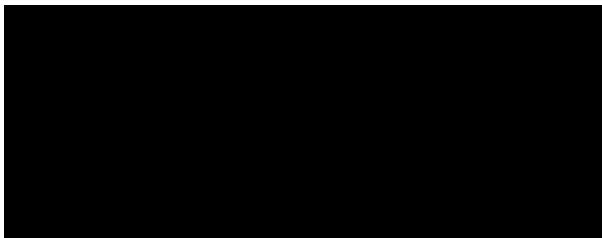

$\mathbb{R}^2 \times S^1$ is also known as the $SE(2)$ group.

Group of homogeneous transformations in 2D

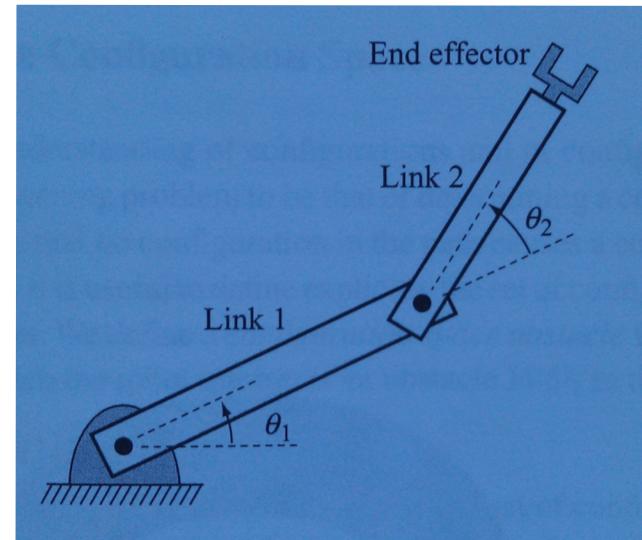

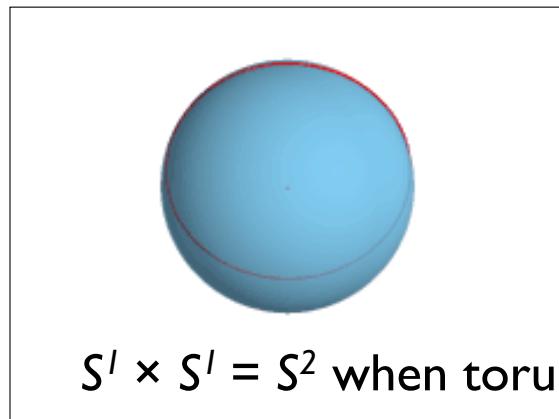

C-space examples

- What is the C-space of a planar arm with 2 rotational joints?

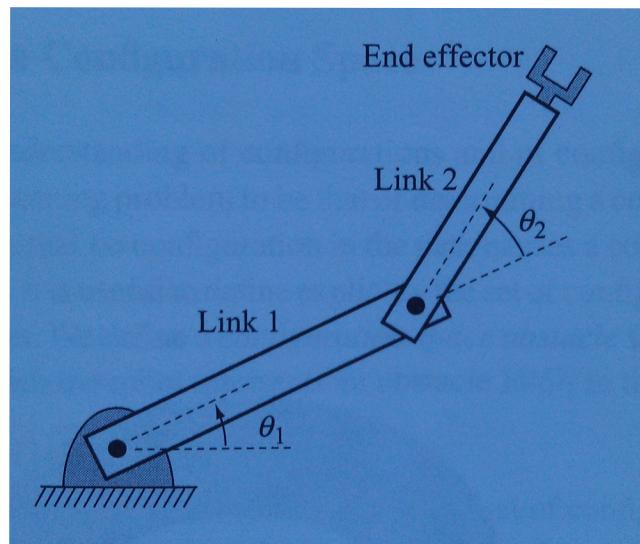

C-space examples

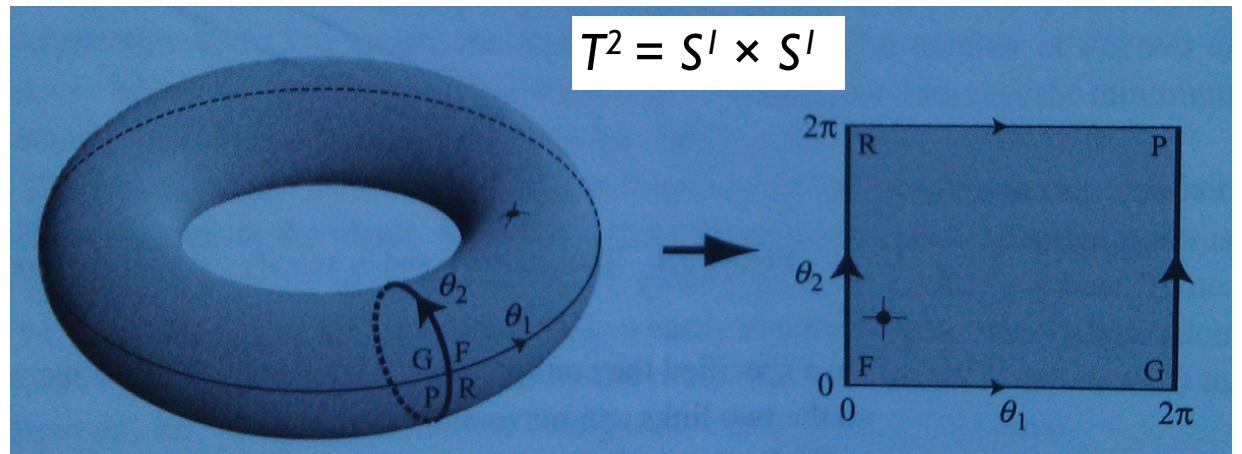

- What is the C-space of a planar arm with 2 rotational joints?
 - DOFs: 2, $\{\Theta_1, \Theta_2\}$
 - C-space: \mathbb{R}^2 or S^2 or $S^1 \times S^1$?

T^2 Torus Group

Space must fuse on each DOF where $2\pi = 0$

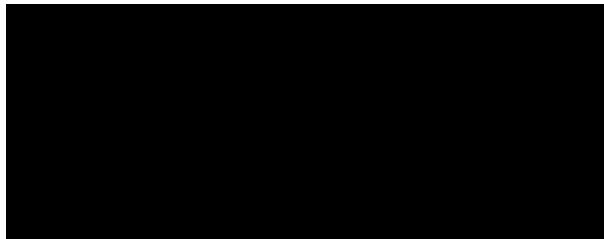

T^n is the torus group for an N-D rotational system

$$T^n = \underbrace{S^1 \times S^1 \times \cdots \times S^1}_n$$

C-space examples

- What is the C-space of a Barrett WAM arm with 4 rotational joints, not including fingers of gripper?

C-space examples

- What is the C-space of a Barrett WAM arm with 4 rotational joints, not including fingers of gripper?
 - DOFs: 4
 - C-space: T^4

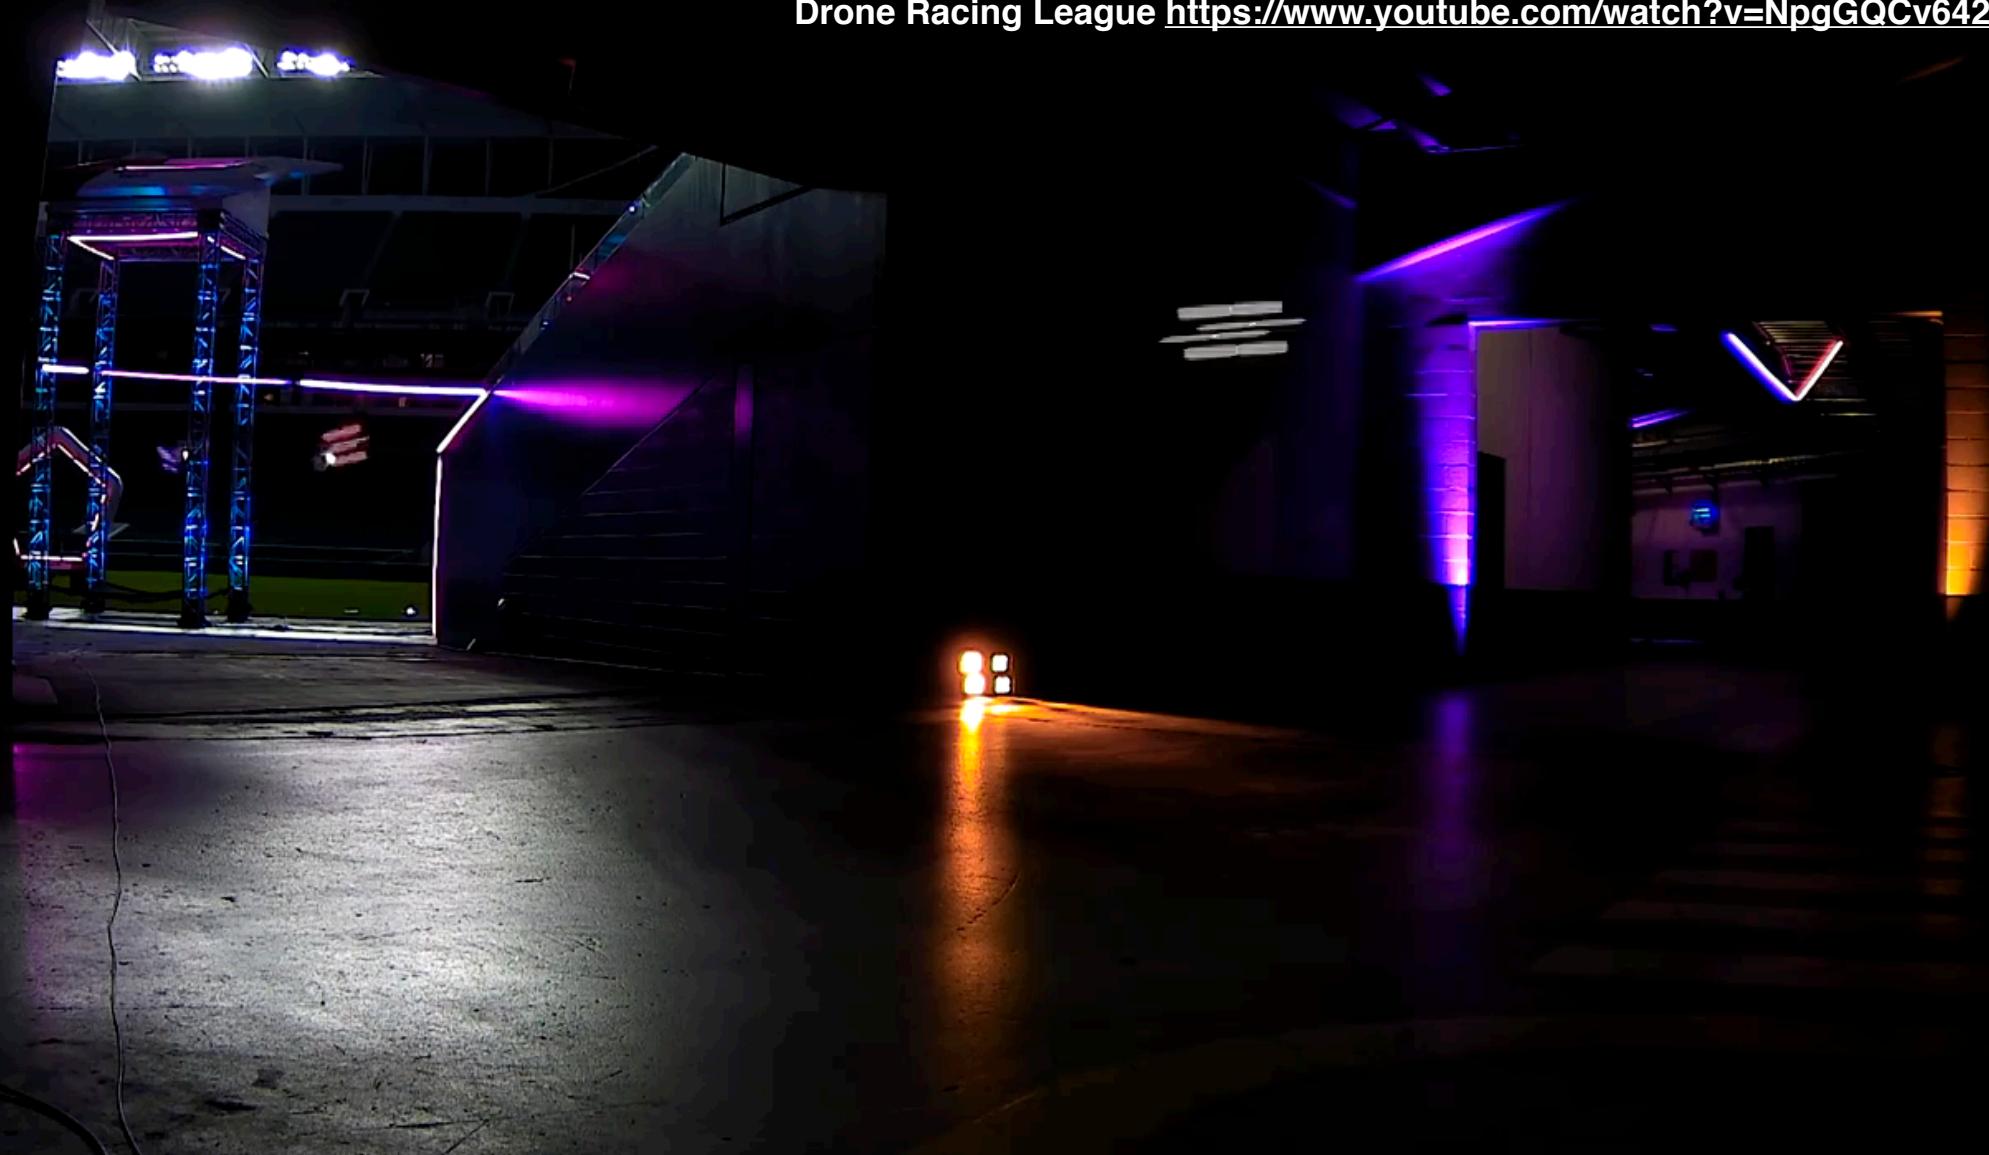

C-space examples

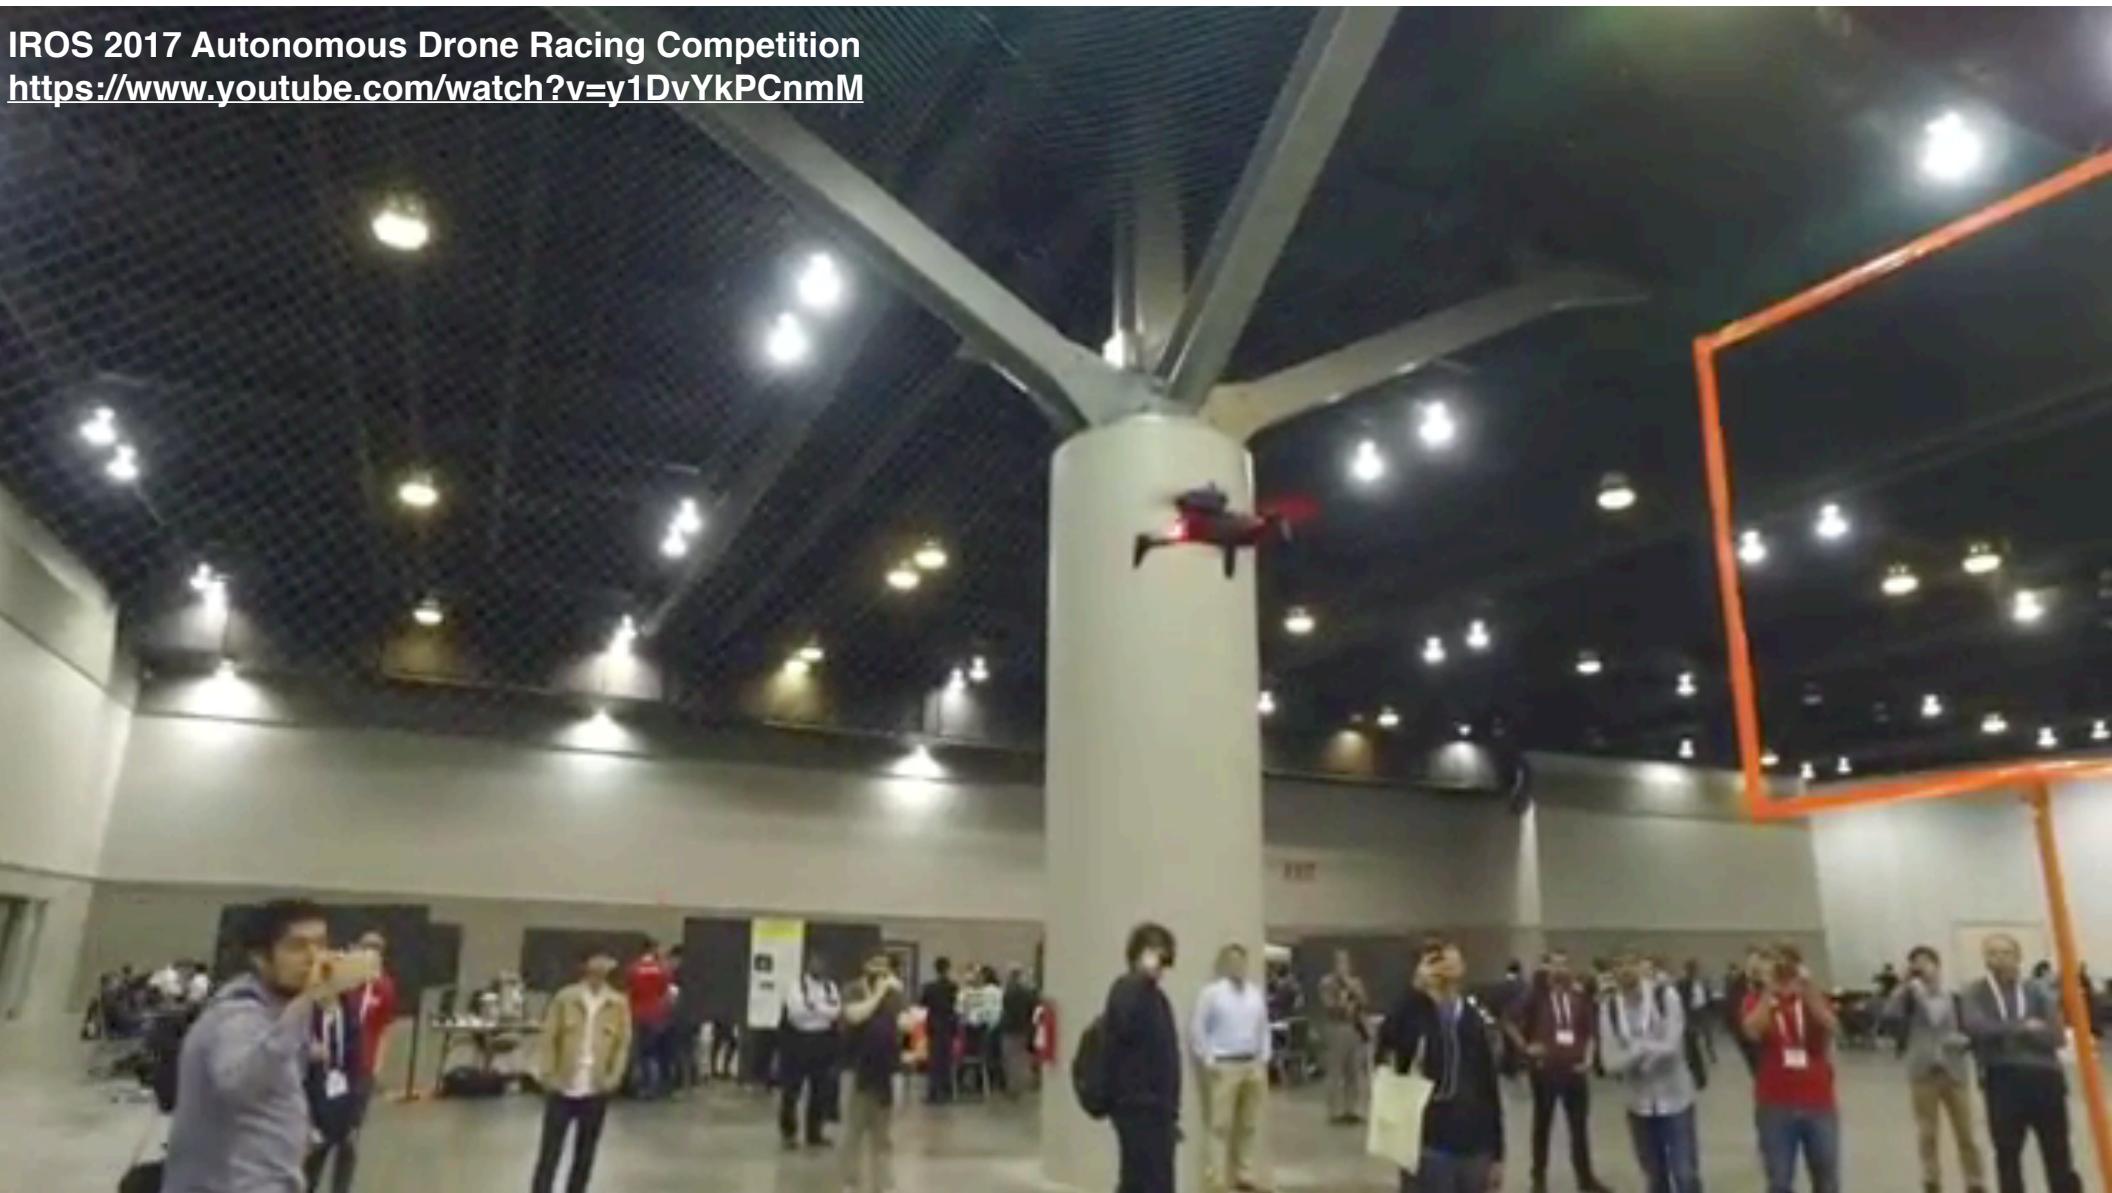

- What is the C-space of a quad rotor helicopter?

Drone Racing League <https://www.youtube.com/watch?v=NpgGQCv642o>

IROS 2017 Autonomous Drone Racing Competition
<https://www.youtube.com/watch?v=y1DvYkPCnmM>

C-space examples

- What is the C-space of a quad rotor helicopter?
- DOFs: 6
- C-space: $SE(3)$,
- or $\mathbb{R}^3 \times SO(3)$

\uparrow \uparrow
3D translation 3D rotation

\leftarrow Group of homogeneous
transformations in 3D

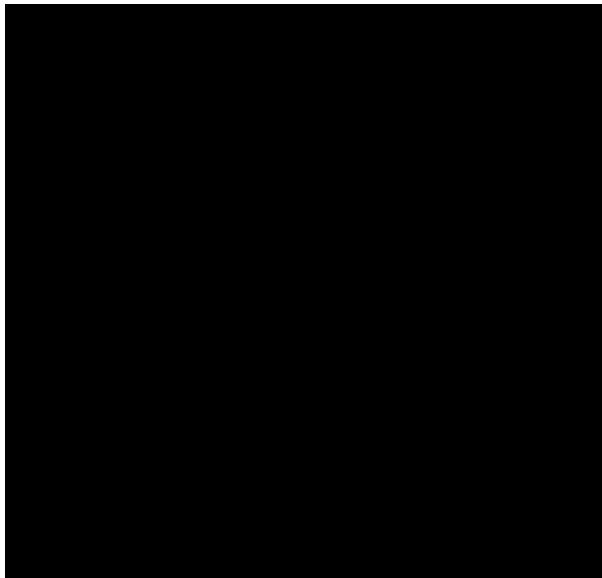

$SE(3)$ combines:
 \mathbb{R}^3 : 3D translation and
 $SO(3)$: 3D rotation

$$SO(3) = S^1 \times S^1 \times S^1$$

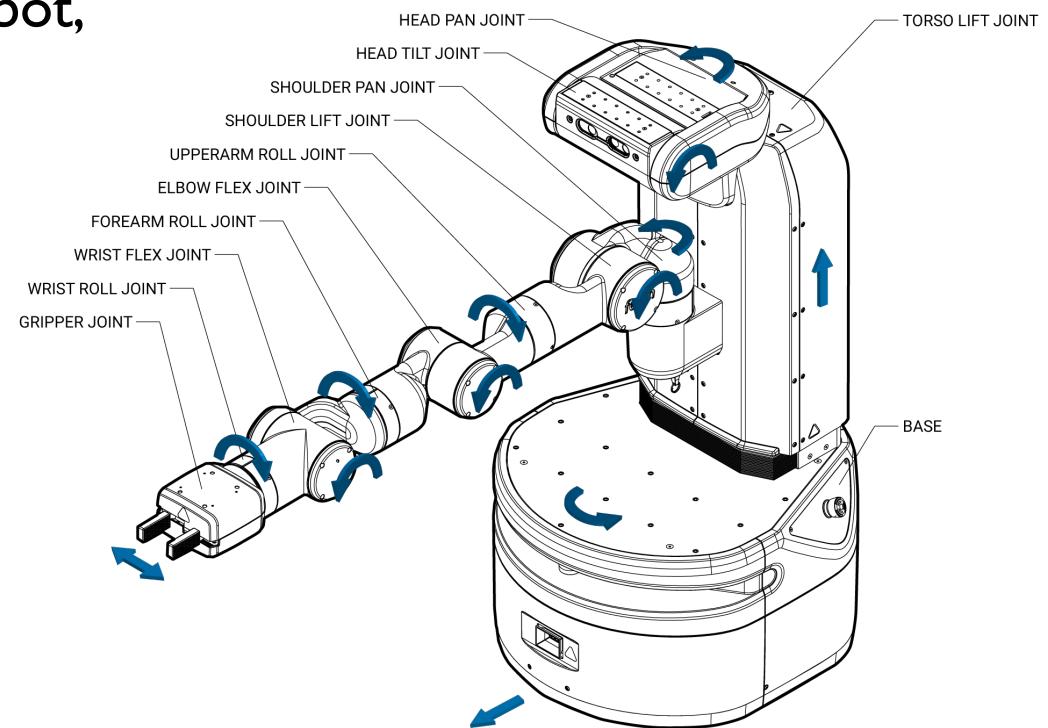

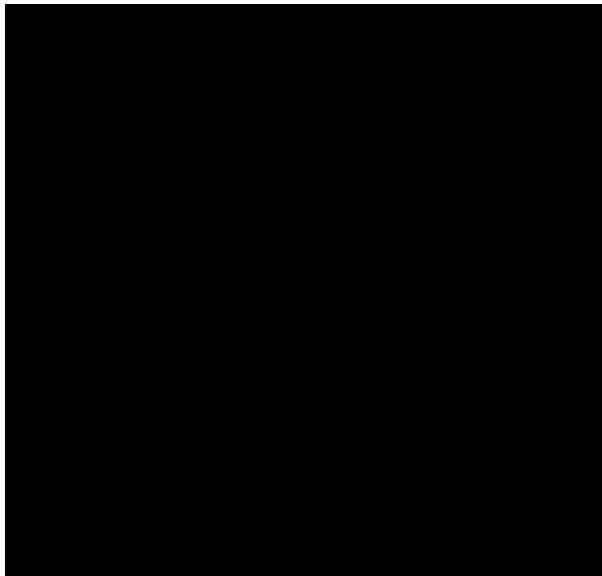

C-space examples

- What is the C-space of a Fetch robot,
not including grippers?

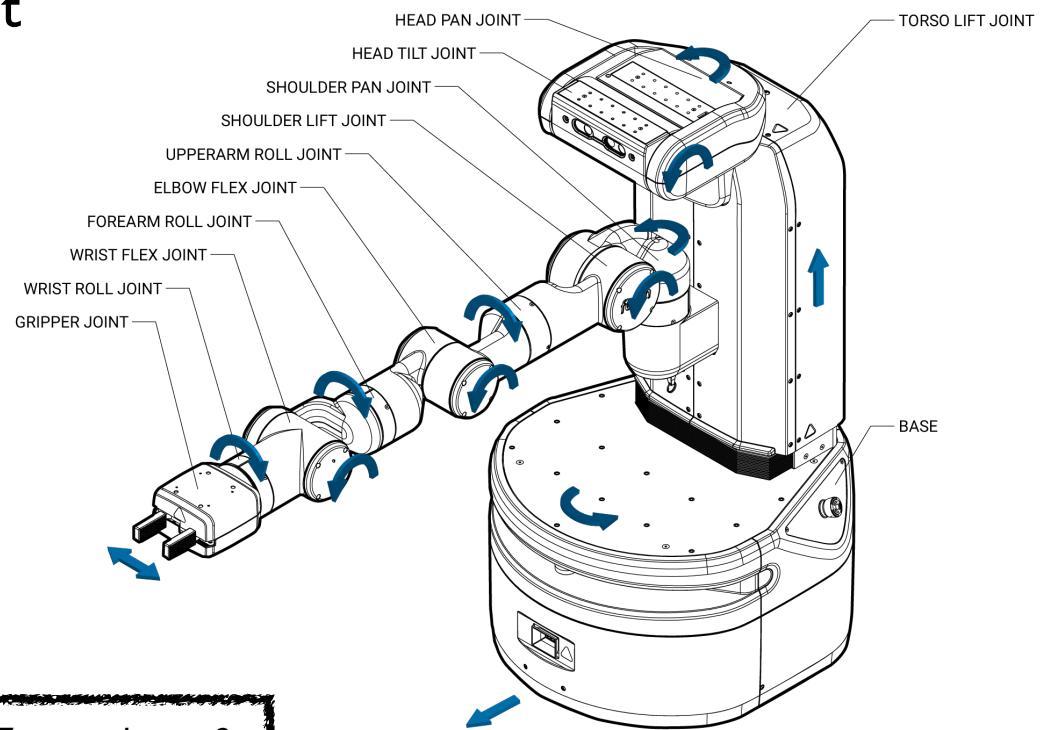

C-space examples

- What is the C-space of a Fetch robot, not including grippers?

C-space examples

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
 - 3 in base: $SE(2)$
 - 7 in arm: T^7
 - 1 in the spine: \mathcal{R}^1
 - 2 in neck: T^2

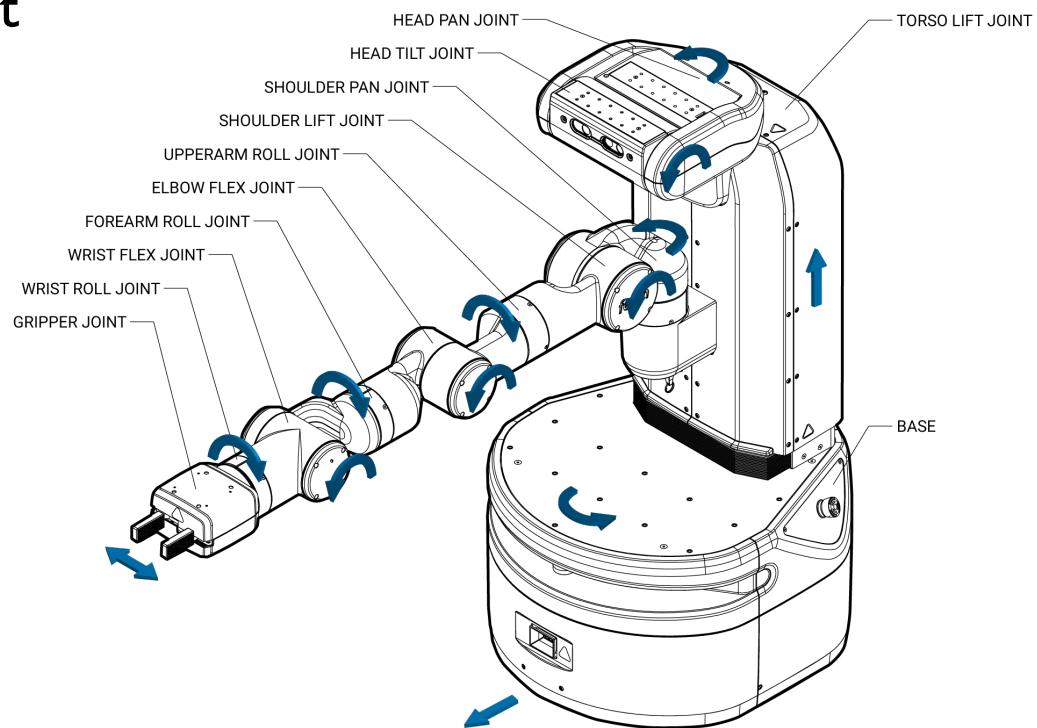

C-space: $SE(2) \times T^7 \times \mathcal{R}^1 \times T^2$

Did we get this wrong?

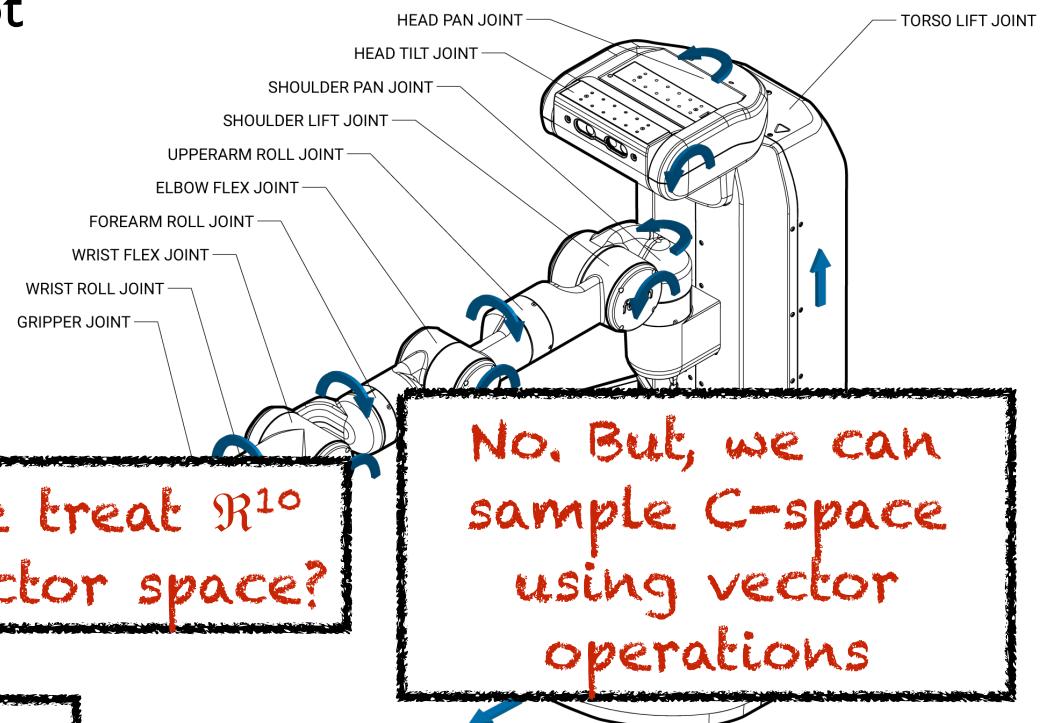

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
- 3 in base: $SE(2)$
- 7 in arm: T^7
- 1 in the spine: \mathcal{R}^1
- 2 in neck: T^2

Consider
joint limits

C-space with joint limits

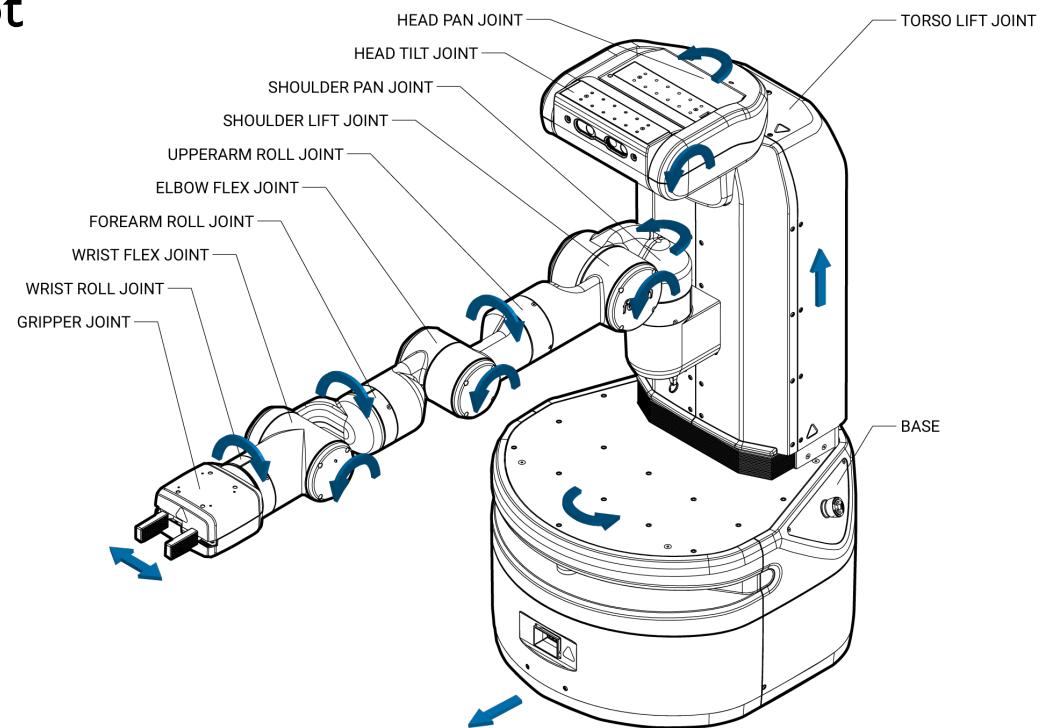

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
- 3 in base: $SE(2)$
- 7 in arm: \mathbb{R}^7
- 1 in the spine: \mathbb{R}^1
- 2 in neck: \mathbb{R}^2

C-space: $SE(2) \times \mathbb{R}^{10}$

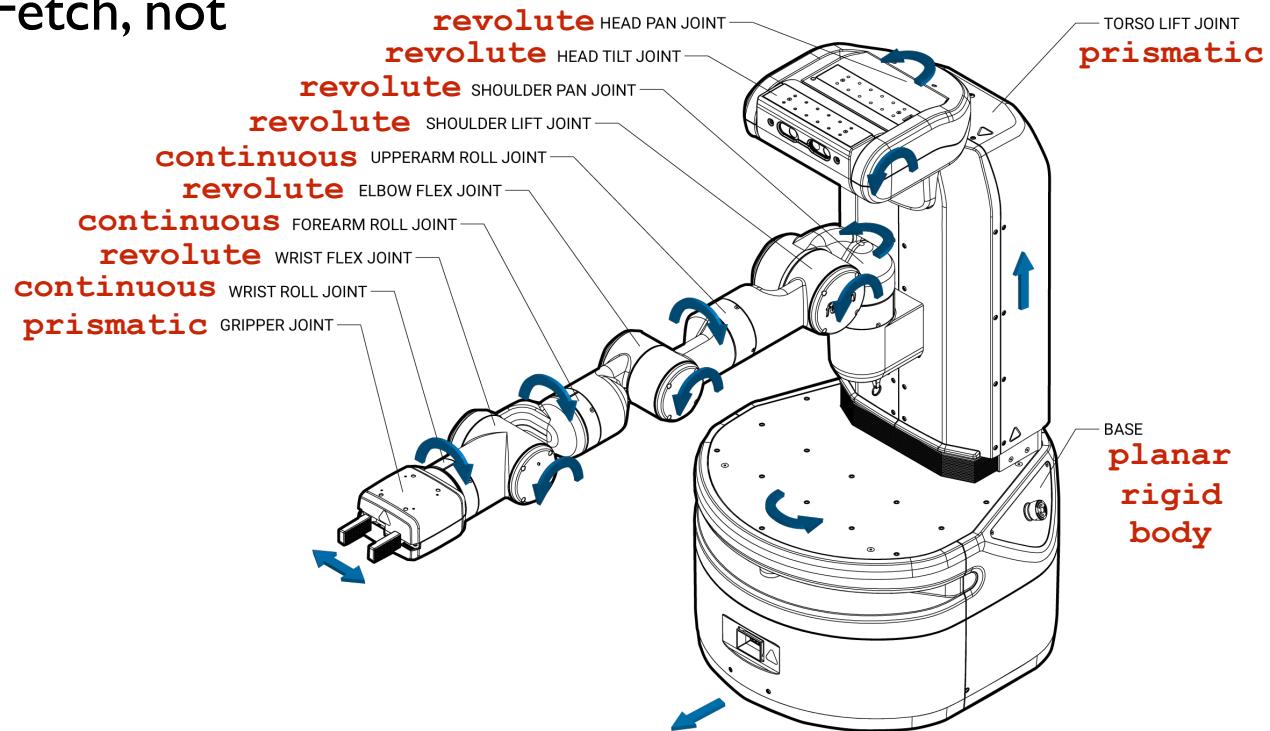

Still not quite right...

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
- 3 in base: $SE(2)$
- 7 in arm: \mathbb{R}^7
- 1 in the spine: \mathbb{R}^1
- 2 in neck: \mathbb{R}^2

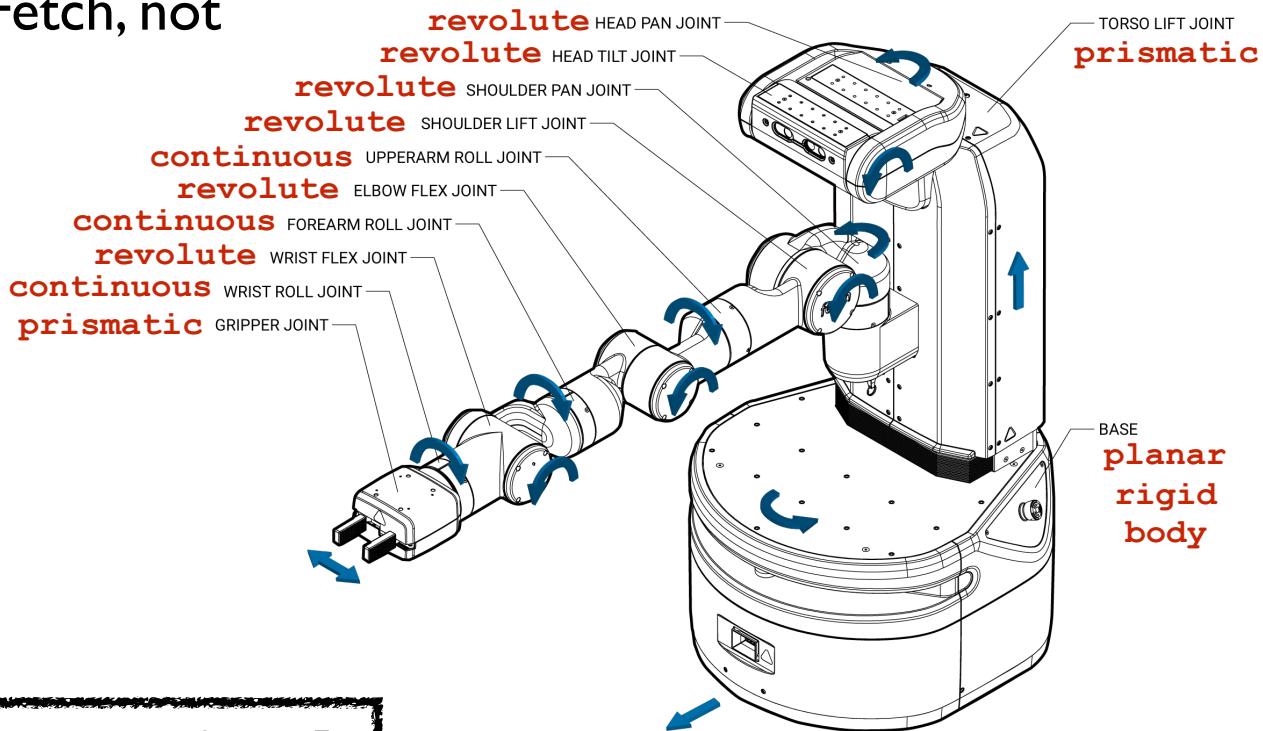

Still not quite right...

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
- 3 in base: $SE(2)$
- 7 in arm: \mathbb{R}^7
- 1 in the spine: \mathbb{R}^1
- 2 in neck: \mathbb{R}^2

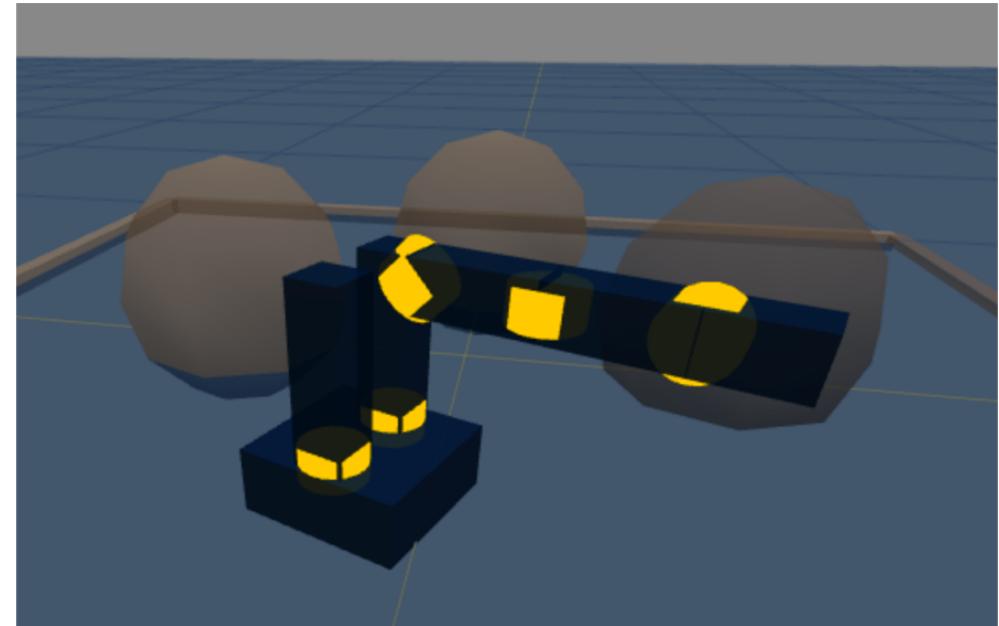

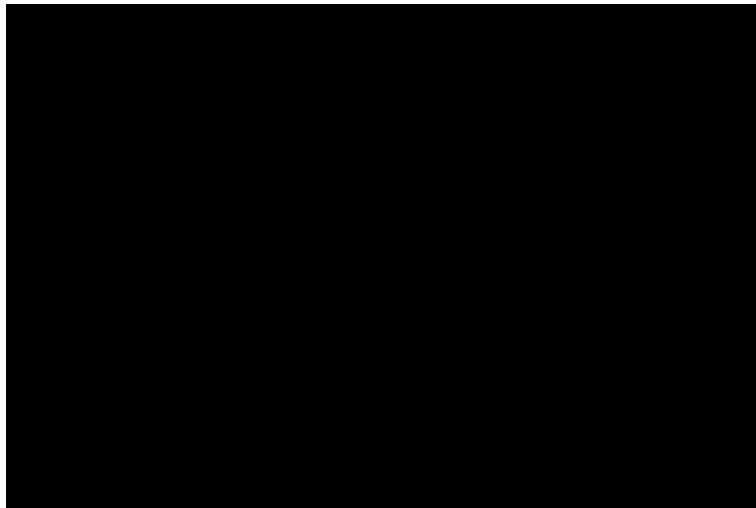

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
- 3 in base: $SE(2)$
- 3 continuous: T^3
- 1 prismatic: \mathbb{R}^1
- 6 revolute: \mathbb{R}^6

 C-space: $SE(2) \times T^3 \times \mathbb{R}^7$

C-space examples

- What is the C-space of a MR2?

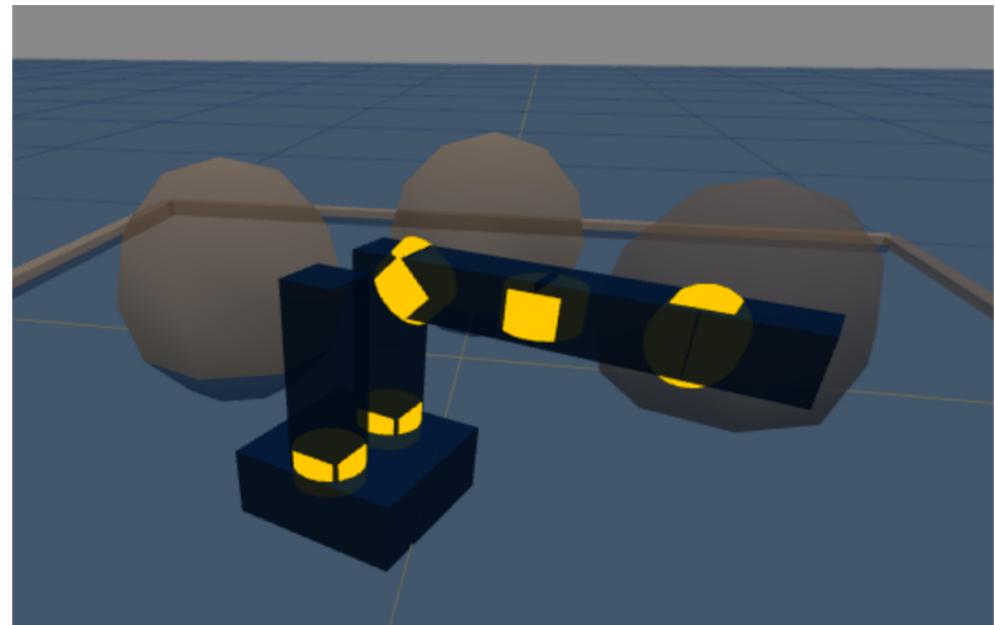

C-space examples

- What is the C-space of a MR2?
- DOFs: 14
 - 3 in base: $SE(2)$
 - 5 in arms: T^5

C-space: $SE(2) \times T^5$

Can we treat $SE(2) \times T^5$
as a vector space?

C-space examples

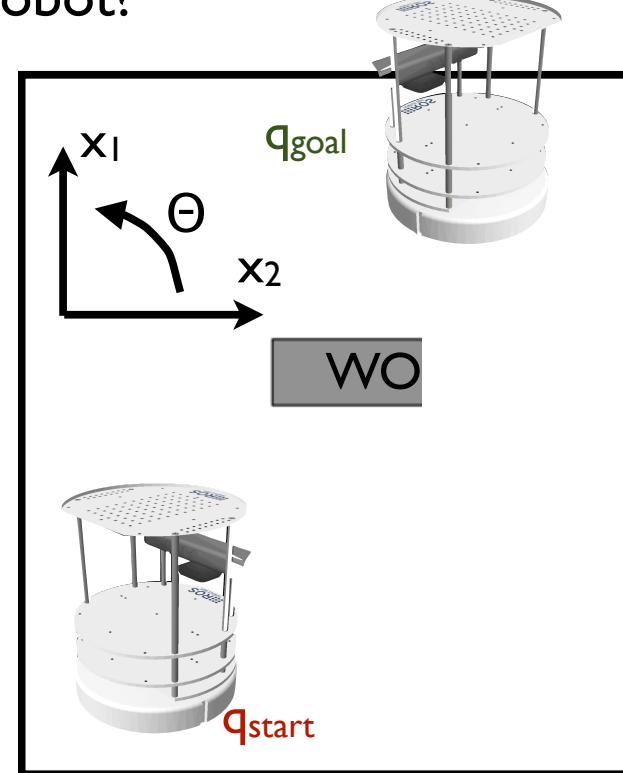

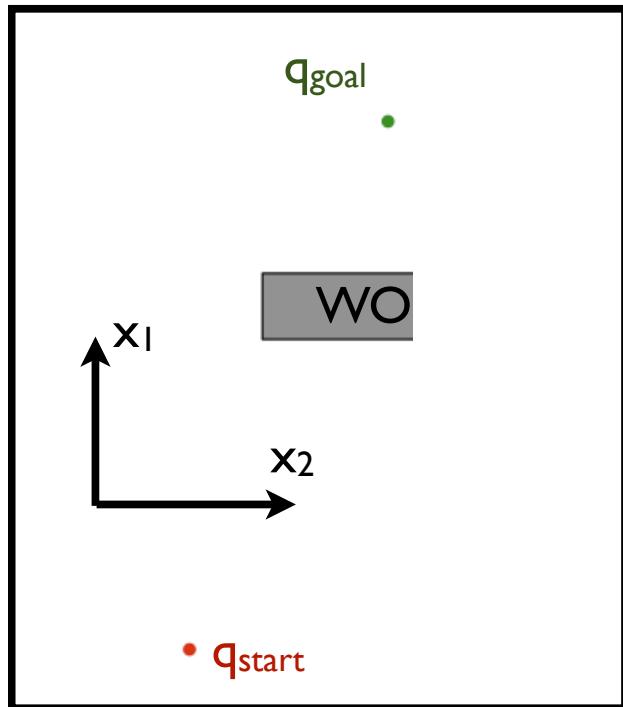

- What is the C-space of a Robonaut 2 on the International Space Station?
- What is the C-space of a PR2?

What about the robot's
physical geometry?

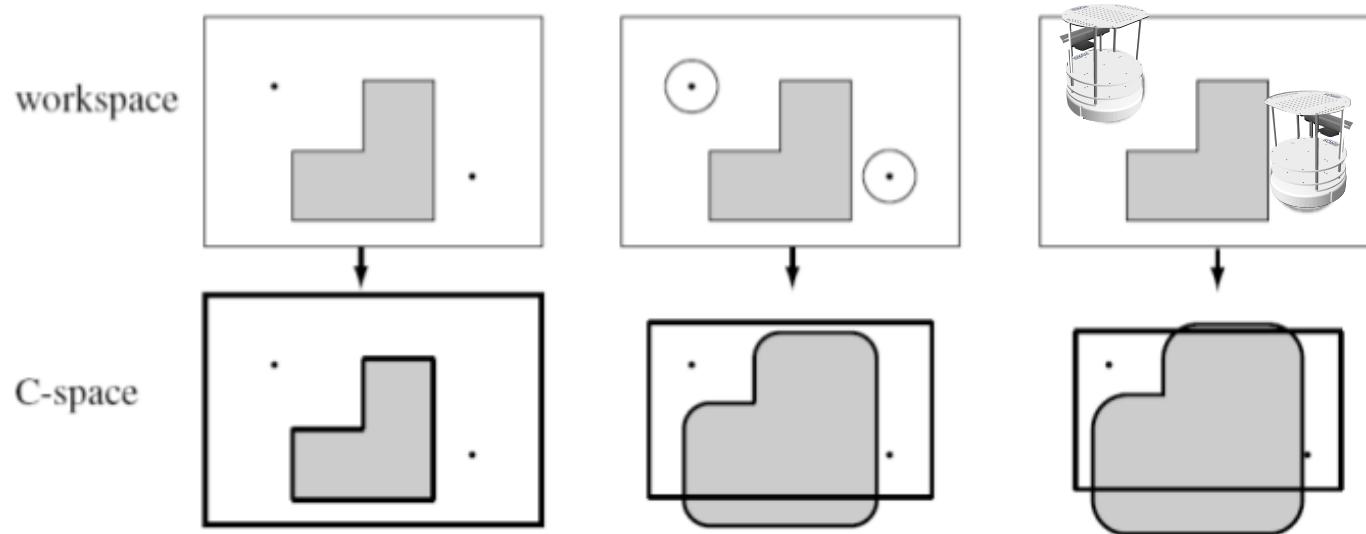

Configuration v. Workspaces

- Other than rotation, how is the Turtlebot different than the point robot?

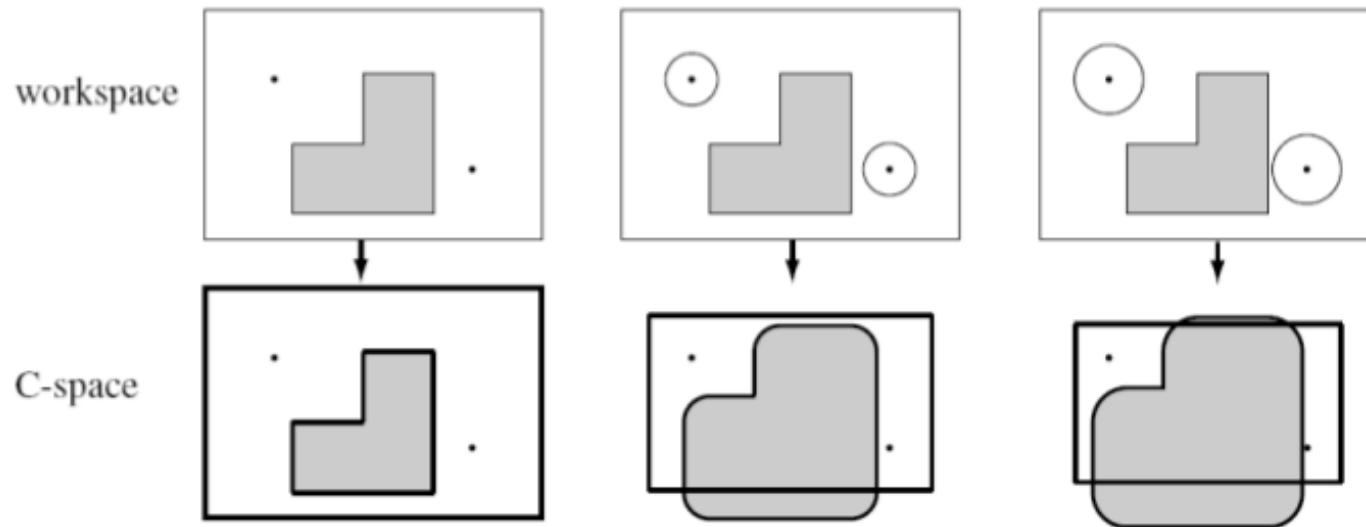

Robot Geometry

- Turtlebot is larger than a point, having a circular radius in the robot's planar workspace
- As this radius increases, the C-space shrinks

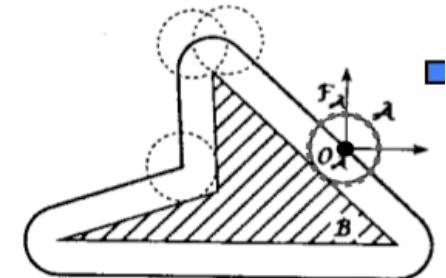

Robot Geometry

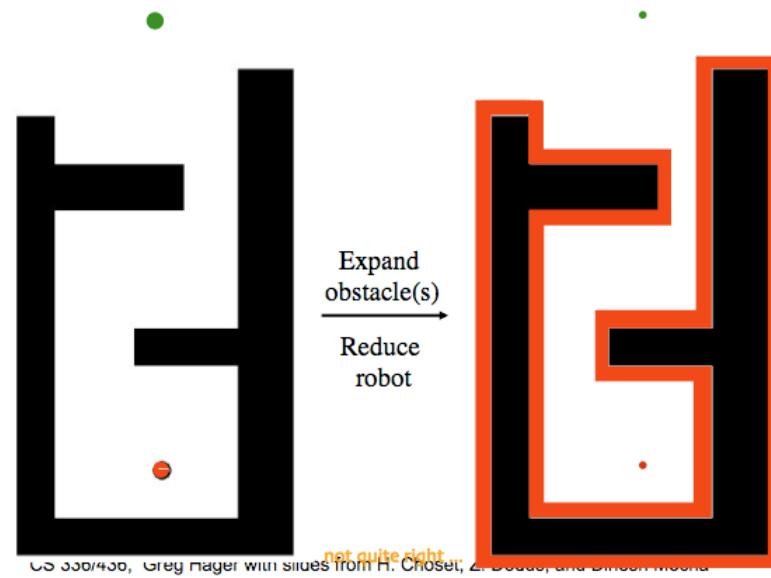

- Turtlebot is larger than a point, having a circular radius in the robot's planar workspace
- As this radius increases, the C-space shrinks

Conversion to point robot C-space

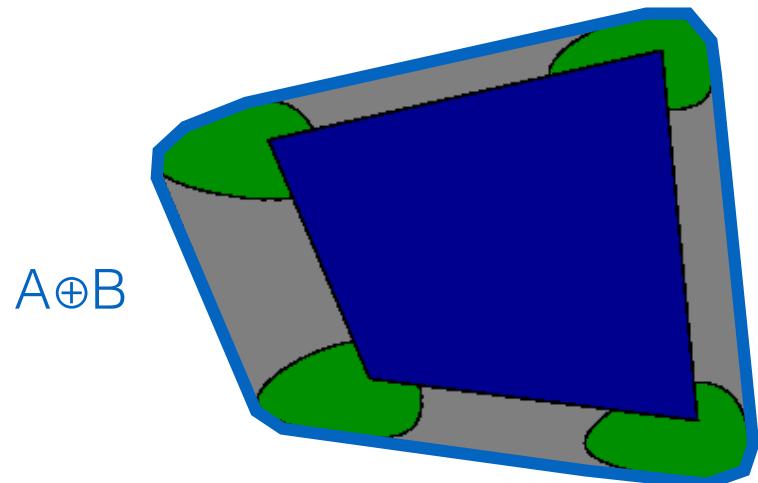

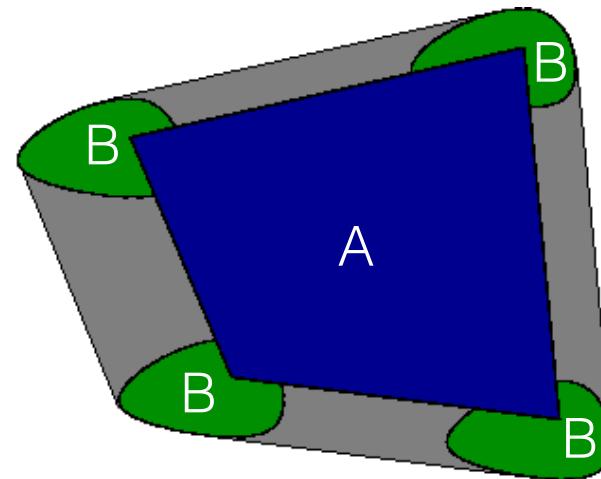

- Workspace for robot can be converted to point robot C-space
- Expand obstacles by tracing robot geometry along boundary
- Performed by Minkowski sum

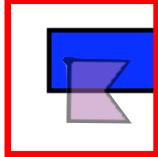

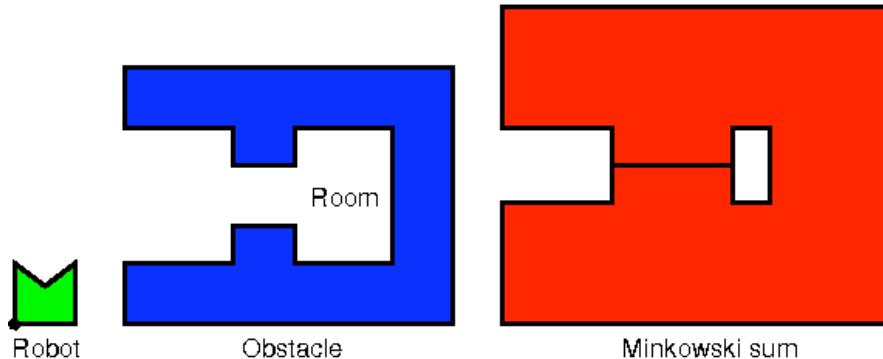

Minkowski Sum (or morphological dilation)

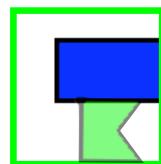

- $A \oplus B: \{a+b \mid a \in A, b \in B\}$
- The result of adding every element of A to every element of B, given two sets A and B in Euclidean space
- Minkowski difference
 - $A \ominus B: \{a-b \mid a \in A, b \in B\}$
 - Known as morphological erosion

Minkowski Planning

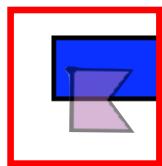

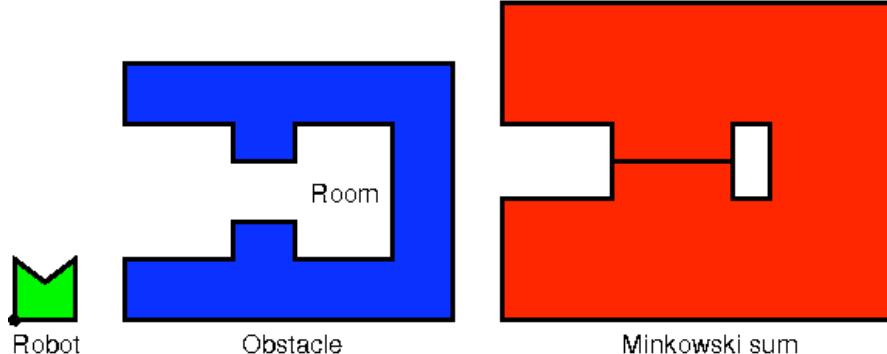

Occlude location if robot intersects obstacle

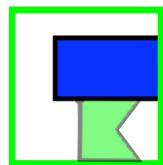

Leave location free if robot
non-intersecting with object

Minkowski sum: identify non intersecting robot locations

Minkowski Planning

Occlude location if robot intersects obstacle

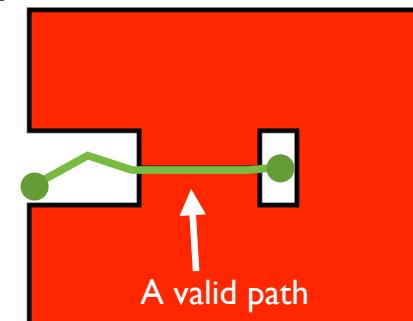

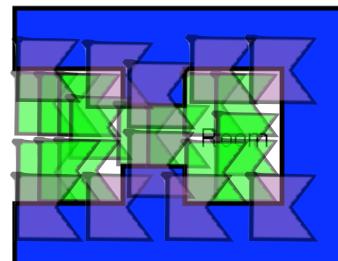

Leave location free if robot non-intersecting with object

Minkowski sum: identify non intersecting robot locations

Space of valid paths defined by Minkowski sum

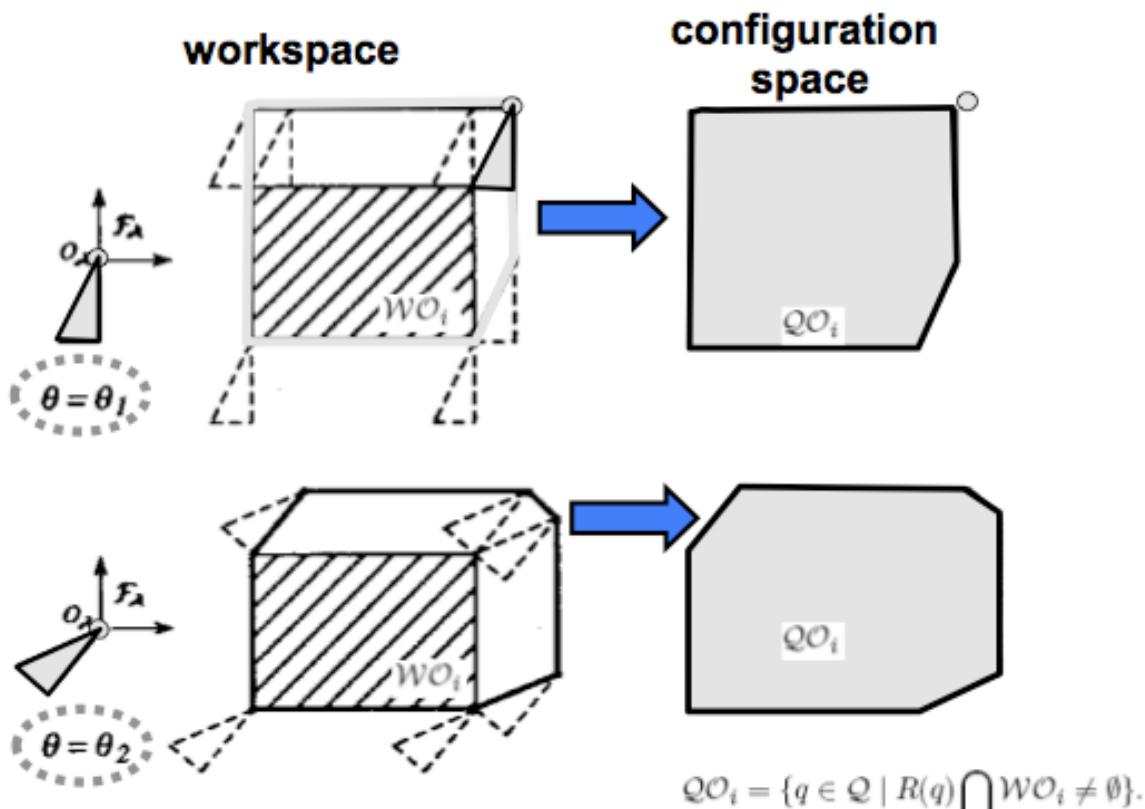

Robot geometry

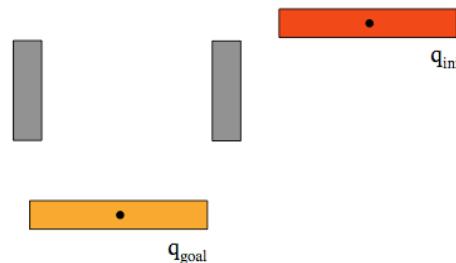

A valid path

What does an obstacle look like
in configuration space?

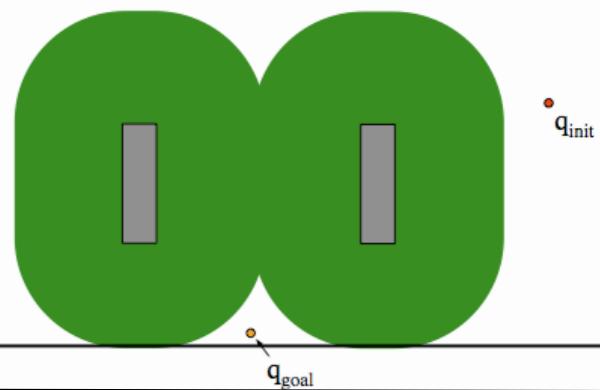

C-space depends on rotation

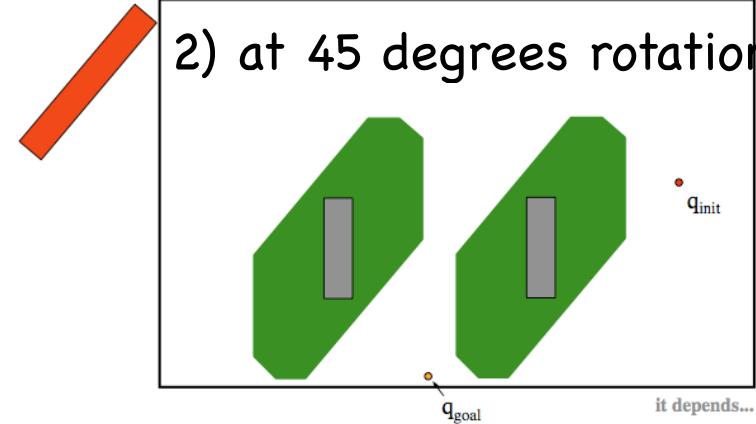

Consider this workspace...

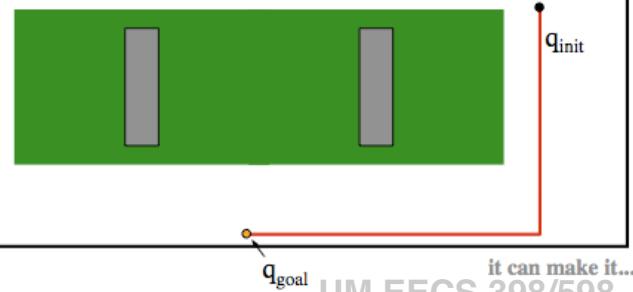

1) over all object rotations

2) at 45 degrees rotation

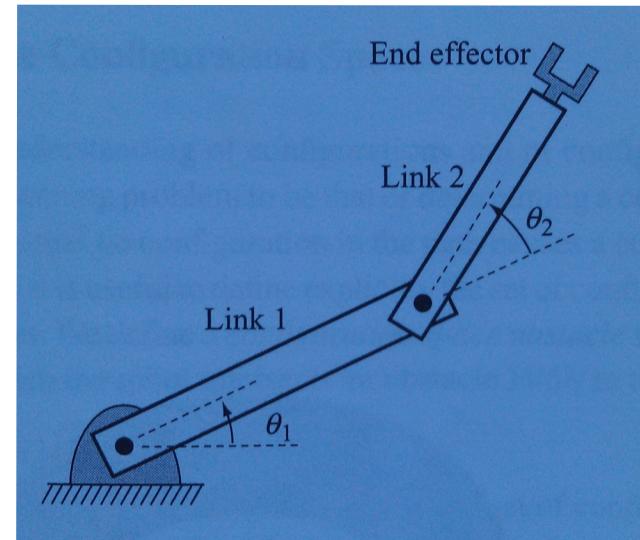

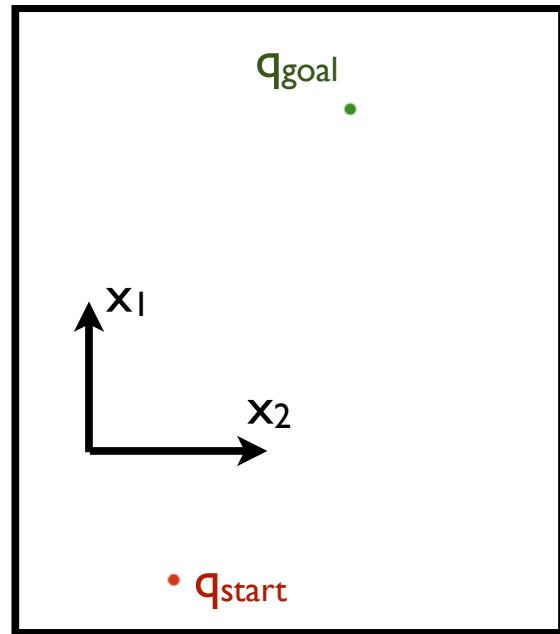

3) at 0 degrees rotation

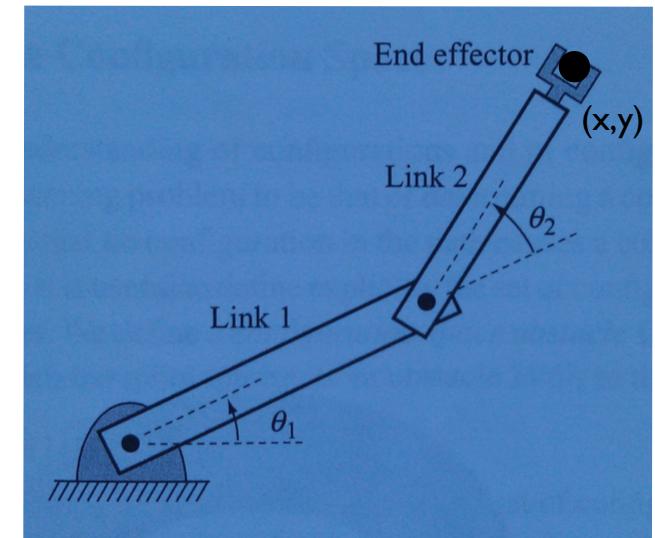

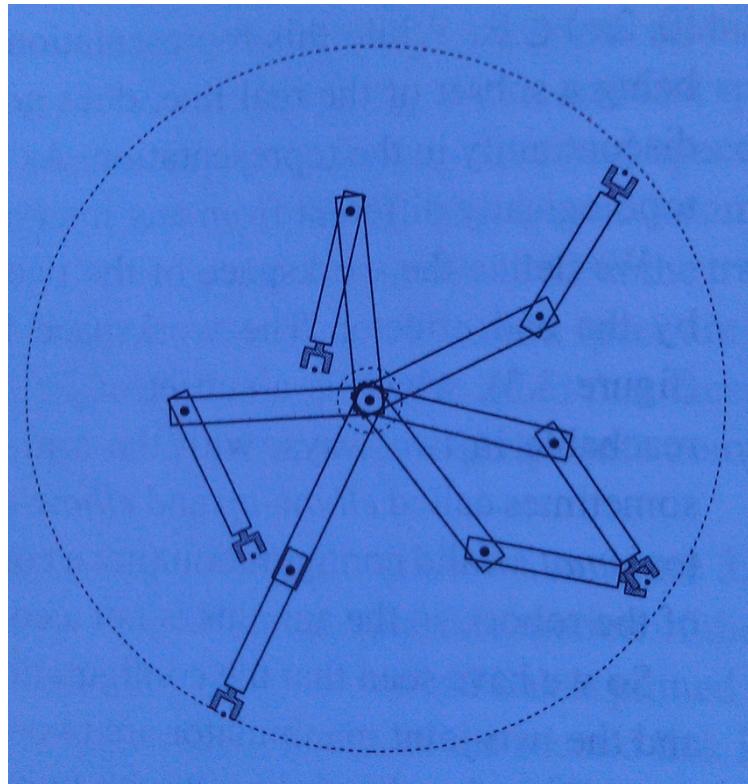

Configuration v. Workspaces

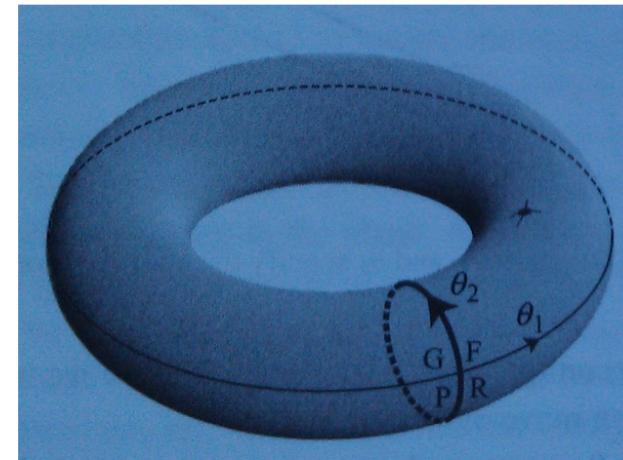

- Other than rotation and geometry, how is the 2-link arm different than the point robot?

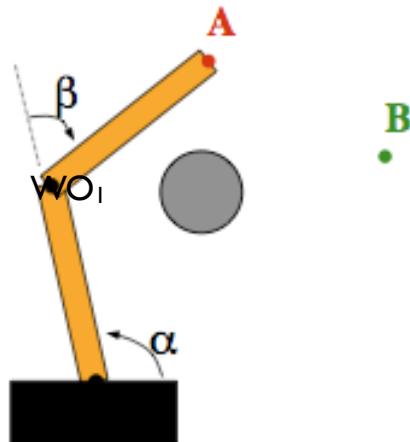

Workspace is w.r.t. end-effector position (x,y)

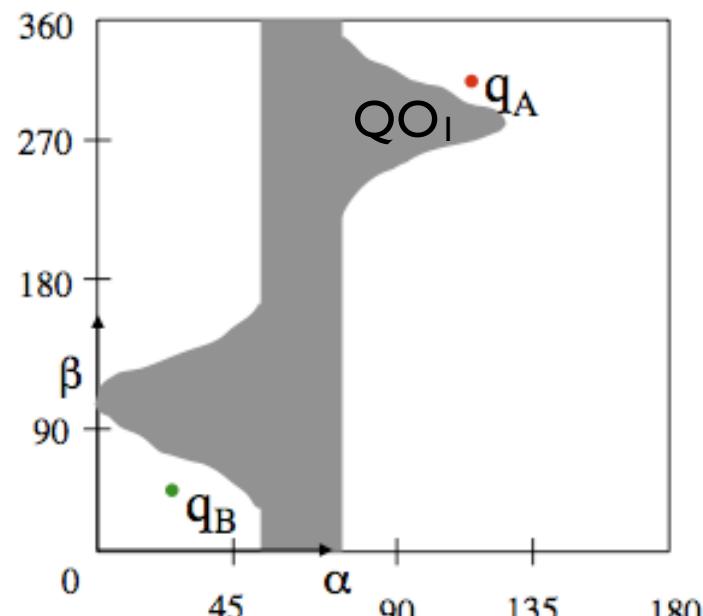

C-space is w.r.t. joint angles (Θ_1, Θ_2)

Obstacles in T^2

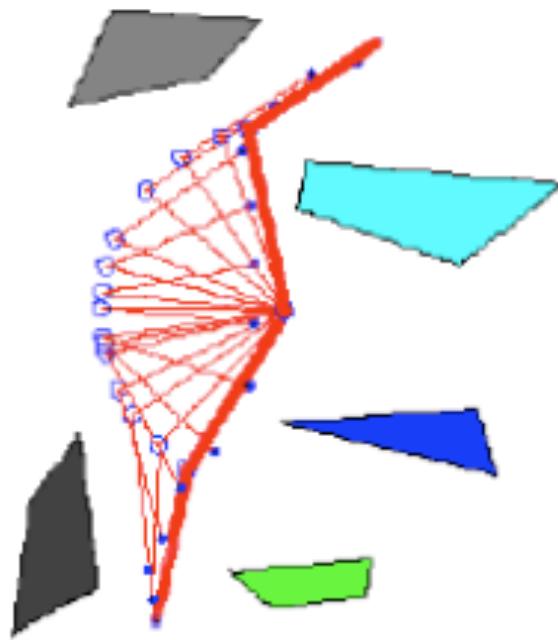

Circular obstacle in workspace

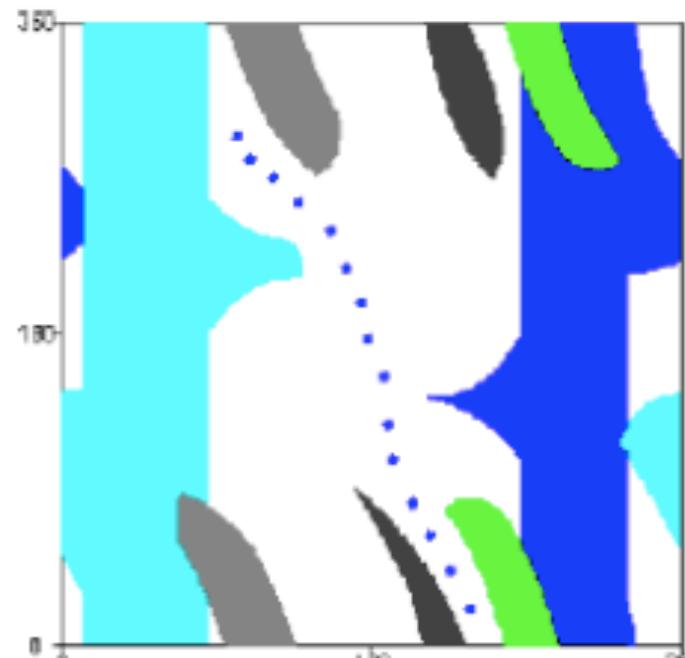

C-space representation

Path in T^2 with several obstacles

Costmaps: Graph Search Revisited

- Optimality as Path length vs. Path cost
- **Costmap** provides weights on graph nodes based on cost factors:
 - Motion: joint limits, holonomicity
 - Collisions and safety: distance from objects, trajectory predictions
 - Traversability and smoothness:

Distance Transform

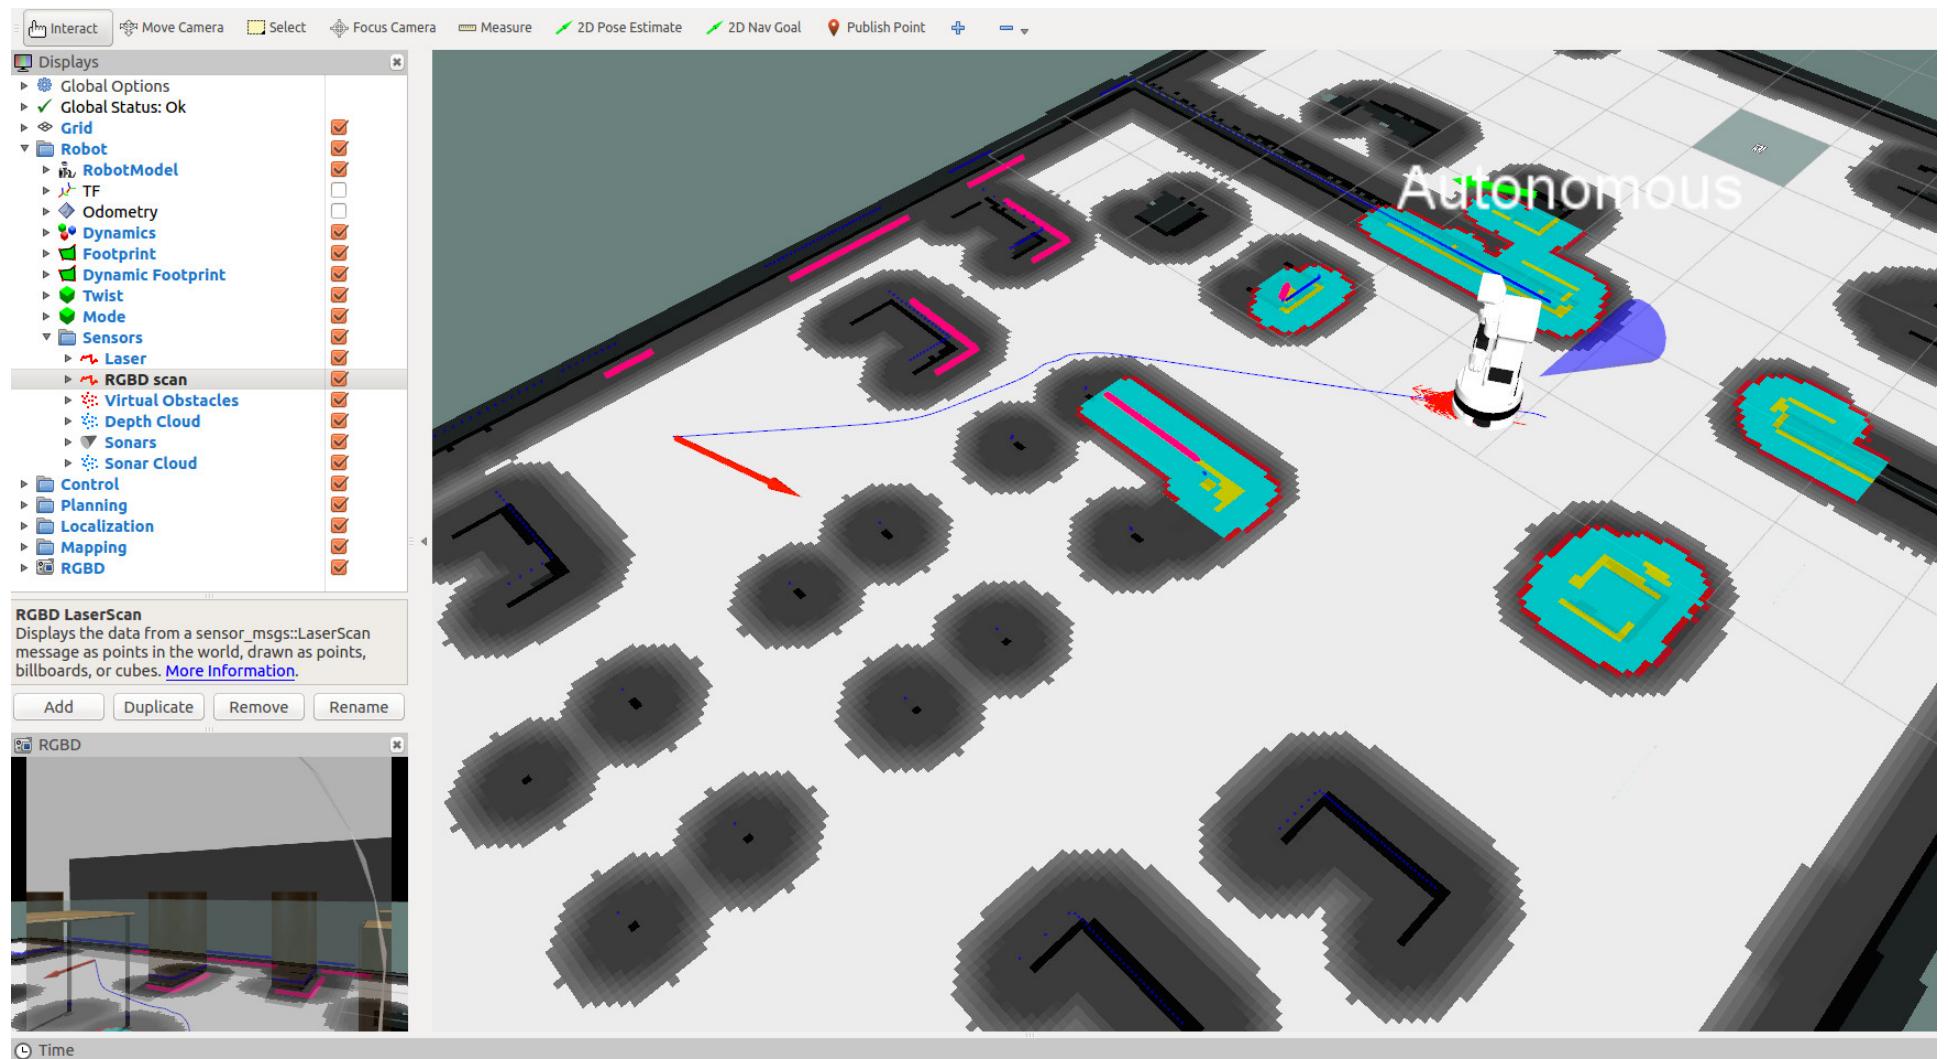

Compute distance of each grid cell to nearest obstacle boundary;
Weight grid cell cost higher if closer to a boundary

Search algorithm template

```
all nodes  $\leftarrow \{\text{dist}_{\text{start}} \leftarrow \text{infinity}, \text{parent}_{\text{start}} \leftarrow \text{none}, \text{visited}_{\text{start}} \leftarrow \text{false}\}$ 
start_node  $\leftarrow \{\text{dist}_{\text{start}} \leftarrow 0, \text{parent}_{\text{start}} \leftarrow \text{none}, \text{visited}_{\text{start}} \leftarrow \text{true}\}$ 
visit_list  $\leftarrow \text{start\_node}$ 

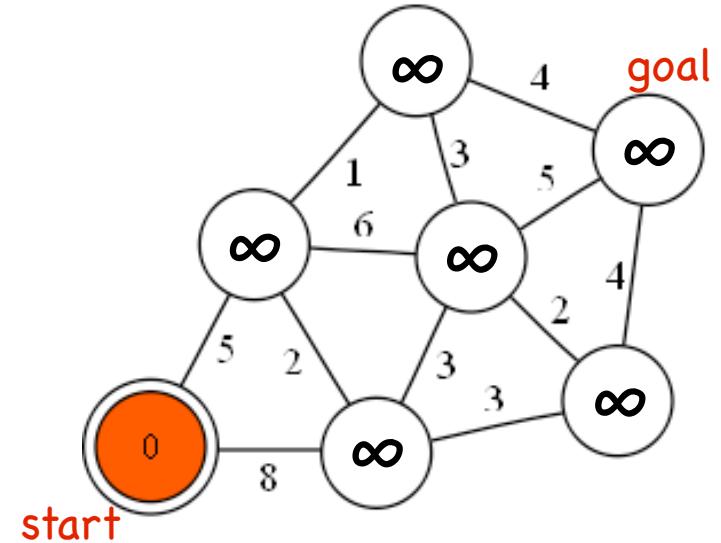

while visit_list != empty && current_node != goal
    cur_node  $\leftarrow \text{highestPriority}(\text{visit\_list})$ 
    visitedcur_node  $\leftarrow \text{true}$ 
    for each nbr in not_visited(adjacent(cur_node))
        add(nbr to visit_list)
        if distnbr > distcur_node + distance(nbr,cur_node)
            parentnbr  $\leftarrow \text{current\_node}$ 
            distnbr  $\leftarrow \text{dist}_{\text{cur\_node}} + \text{distance}(\text{nbr}, \text{cur\_node})$ 
        end if
    end for loop
end while loop
output  $\leftarrow \text{parent, distance}$ 
```

Search algorithm template

```
all nodes  $\leftarrow \{\text{cost}_{\text{start}} \leftarrow \text{infinity}, \text{parent}_{\text{start}} \leftarrow \text{none}, \text{visited}_{\text{start}} \leftarrow \text{false}\}$ 
start_node  $\leftarrow \{\text{cost}_{\text{start}} \leftarrow 0, \text{parent}_{\text{start}} \leftarrow \text{none}, \text{visited}_{\text{start}} \leftarrow \text{true}\}$ 
visit_list  $\leftarrow \text{start\_node}$ 

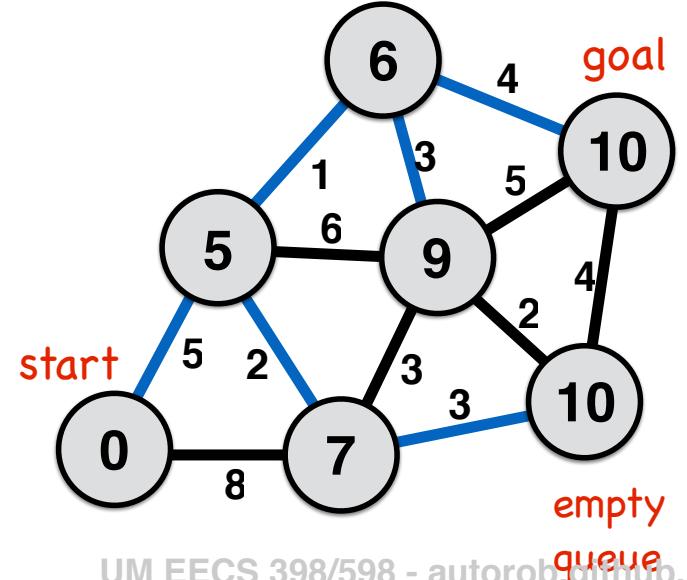

while visit_list != empty && current_node != goal
    cur_node  $\leftarrow \text{highestPriority}(\text{visit\_list})$ 
    visitedcur_node  $\leftarrow \text{true}$ 
    for each nbr in not_visited(adjacent(cur_node))
        add(nbr to visit_list)
        if costnbr > costcur_node + cost(nbr)
            parentnbr  $\leftarrow \text{current\_node}$ 
            costnbr  $\leftarrow \text{cost}_{\text{cur\_node}} + \text{cost}(\text{nbr})$ 
        end if
    end for loop
end while loop
output  $\leftarrow \text{parent, distance}$ 
```

A-star shortest path algorithm

```
all nodes ← {coststart← infinity, parentstart ← none, visitedstart ← false}  
start_node ← {coststart← 0, parentstart ← none, visitedstart ← true}  
visit_queue ← start_node  
while (visit_queue != empty) && current_node != goal  
    dequeue: cur_node ← f_score(visit_queue)  
    visitedcur_node ← true  
    for each nor in not_visited(adjacent(cur_node))  
        enqueue: nbr to visit_queue  
        if costnbr > costcur_node + cost(nbr)  
            parentnbr ← current_node  
            costnbr ← costcur_node + cost(nbr)  
            f_score ← costnbr + line_distancenbr,goal  
        end if  
    end for loop  
end while loop  
output ← parent, distance
```

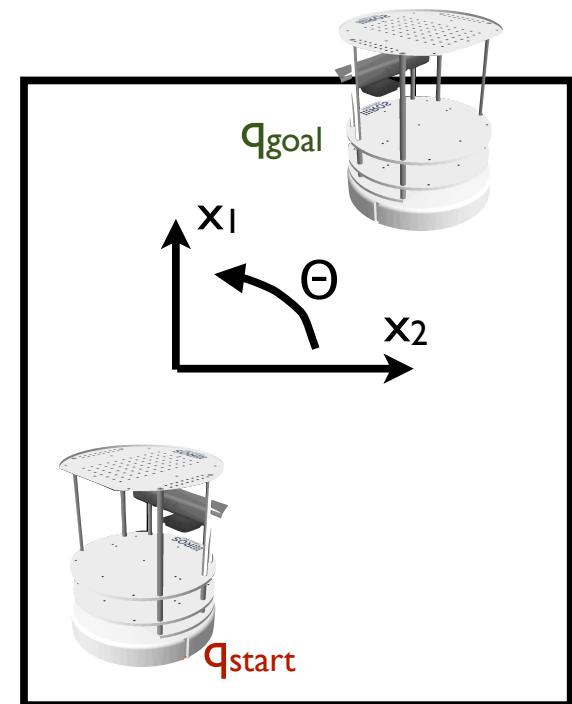

g_score: cost from start *h_score: optimistic cost to goal*

Holonomicity

- Does the Turtlebot have 2 DOFs, instead of 3?
- The Turtlebot can only move along 2 axes
 - linear: forward/backward
 - angular: turning

Turtlebot is nonholonomic
